Seattle Metro Area Independent Artist Revenues 2011	30
Seattle Metro Area Performing Arts Participation Revenues 2011	30
Technical Report	30

### Introduction

This report details the findings of research on the overall health of a region's arts-related creative economy. The strongest indicator of this health is a region's Creative Vitality<sup>™</sup> Index (CVI<sup>™</sup>) value. The CVI<sup>™</sup> is a robust and inclusive measure of the economic vitality of the arts and arts activities in a specified geographic or political region of the United States. Rigorously constructed and updated annually, a region's CVI<sup>™</sup> report is a credible and clear data source for arts research and advocacy purposes.

### What is an Index?

An index is generally an efficient means of summarizing quantities of interrelated information and describing complex relationships. An index can be, as in the case of the CVI<sup>™</sup>, a single indicator of multiple variables and interactions between these variables. Changes in an index will reflect changes in the data used to generate the index. Standardization and unification of data mean that indexes are ideally suited for comparative analysis. The comparative nature of the CVI<sup>™</sup> has added analytical and policy value.

### What is the Creative Vitality<sup>™</sup> Index?

The Creative Vitality<sup>™</sup> Index (CVI<sup>™</sup>) measures annual changes in the economic health of an area by integrating economic data streams from both the for-profit and non-profit sectors. Using per capita measurements of revenue data from both for-profit and non-profit entities as well as job data from a selection of highly creative occupations, the research aggregates the data streams into a single index value that reflects the relative economic health of a geography's creative economy. The CVI<sup>™</sup> provides an easily comprehensible measure of economic health to help communicate information from a broad arts coalition to policy makers and stakeholders. This longitudinal data allows for compelling year-to-year comparisons as well as cross-city, county, and state comparisons. The CVI<sup>™</sup> research system also provides users with a series of reports on the rise and fall of key data factors measured by the index. The CVI<sup>™</sup> goes beyond an annual tally of what is often inflation-driven growth in the non-profit art sector. Instead, it is a more inclusive reporting mechanism that is rooted in robust data streams that reflect the entire arts-based creative economy.

The Creative Vitality<sup>™</sup> Index is a resource for informing public policy and supporting the work of advocates for creative economies. CVI<sup>™</sup> reports have been used as a way to define the parameters of an area's creative economy and as a means of educating communities about the components and dynamics of a creative economy. The CVI<sup>™</sup> is frequently used as a source of information for arts advocacy messaging and to call attention to significant changes in regional creative economies. This research has also been used to underscore the economic relationships between the for- and non-profit sectors and as a mechanism for diagnosing a region's creative strengths and weaknesses.

## What does the Creative Vitality<sup>™</sup> Index Measure?

The CVI<sup>™</sup> measures a carefully selected set of economic inputs related to the arts and creativity in a given geographic area, with measurements of both for-profit and non-profit arts-related activities. The index has two major components including measurements of community participation based on per capita revenues of arts-related goods and services, and measurements of per capita occupational employment in the arts. The weighted indicators within the community participation portion of the index are the following: non-profit arts organization income, non-profit humanities organizational income, per capita book store sales, per capita music store sales, per capita photography store sales, per capita performing arts revenues, and per capita art gallery and individual artist sales. These indicators account for sixty percent of the overall index values. A forty percent weighting has been assigned to occupational employment in the arts that captures the incidence of jobs associated with

measurably high levels of creative output.

The rationale for this approach is the cause-and-effect relationship between participation levels and jobs. The underlying theory is that public participation in the arts or public demand for arts experiences and events ultimately drives budgets and organizational funding levels, which in turn support artists and art-related jobs within the economy.

### Where does Creative Vitality<sup>™</sup> Index Data Come From?

Index data streams are analyzed by WESTAF and taken from two major data partners: the Urban Institute's National Center for Charitable Statistics, and Economic Modeling Specialists, International (EMSI). The Urban Institute's National Center for Charitable Statistics aggregates information from the Internal Revenue Service's 990 forms. The forms are required to be submitted by non-profit 501(c) organizations with annual gross receipts of \$25,000 or more; however, organizations with smaller revenues also occasionally report. EMSI uses a proprietary economic modeling technique to capture industry and occupational employment data. A brief synopsis of the data sources employed in this model are outlined as follows:

### Industry Data

In order to capture a complete picture of industry employment, EMSI combines covered employment data from Quarterly Census of Employment and Wages (QCEW), produced by the Department of Labor, with total employment data in Regional Economic Information System (REIS), published by the Bureau of Economic Analysis (BEA) and augmented with County Business Patterns (CBP) and Nonemployer Statistics (NES), published by the U.S. Census Bureau.

### Occupation Data

Organizing regional employment information by occupation provides a workforce-oriented view of the regional economy. EMSI's occupation data are based on EMSI's industry data and regional staffing patterns taken from the Occupational Employment Statistics program (U.S. Bureau of Labor Statistics). Wage information is partially derived from the American Community Survey. The occupation-to-program (SOC-to-CIP) crosswalk is based on one from the U.S. Department of Education, with customizations by EMSI.

#### Communicating CVI<sup>™</sup> Data

Different state, local, and regional organizations have undertaken multiple communication strategies for publicizing the results of their CVI™ reports. WESTAF has found that the best strategy for communicating CVI™ information often relies on the specifics of organizational needs.

WESTAF is willing to consult individual agencies free of charge regarding communication strategies after CVI<sup>™</sup> data have been finalized. Potential strategies include: creating low-cost communication pieces and press releases "in-house"; creating more formalized communication; using a professional designer; including a number of stories related to the local creative economies; forming working groups to discuss the creative economy and long-term messaging strategies based on CVI<sup>™</sup> data; commissioning in-depth research to investigate certain aspects of CVI<sup>™</sup> data apparent in the overall CVI<sup>™</sup> results; and using CVI<sup>™</sup> data as an internal policy formulation document, while communicating data to specific key stakeholders, such as legislators and executives.

### Data Preview and Summary

A region's Creative Vitality<sup>™</sup> Index value is compared to a national baseline value of 1.00. For example, a region with a CVI<sup>™</sup> value of 1.30 has a stronger creative vitality index value than the nation as a whole by 30%. A CVI<sup>™</sup> value as compared to a specific region—a county, state, or combined area—can also be generated. The unique geographic sensitivity of this measure means that arts advocates and policy makers have a clear and concise understanding of their particular region.

Important to note is that this report includes select City of Seattle ZIP codes and other ZIP codes located within the Seattle Metro Area. These ZIP codes were included by WESTAF at the request of the City of Seattle. This set of ZIP codes, while defining an area larger than the City itself, provides a comprehensive understanding of the creative economy health of the Seattle Metro Area. Keep in mind that the Seattle Metro Area Region, which is defined by a set of ZIP codes, is different than the Seattle Metropolitan Statistical Area, which includes King, Snohomish, and Pierce Counties.

### Seattle Metro Area Data Highlights:

In 2011, the Seattle Metro Area outperformed the United States, the State of Washington, the Pacific Northwest Region, and the Western States Region in all eight categories measured by the CVI<sup>™</sup>. This area also surpassed the Portland Metropolitan Statistical Area (MSA) and the Seattle MSA in seven CVI<sup>™</sup> categories. The Seattle Metro Area's performing arts participation revenues and non-profit arts organization revenues fared well when compared to the above-mentioned geographies. The Seattle Metro Area generated over 2,000 creative jobs, with graphic designers experiencing the area's greatest increase in jobs between 2010 and 2011. There were more than 320 non-profit arts and arts-active organizations within the Seattle Metro Area, and these organizations generated more than \$371 million in revenues in 2011.

## **Additional Data Points**

CVI<sup>™</sup> data streams are analyzed by WESTAF and taken from two major data partners: the Urban Institute's National Center for Charitable Statistics and Economic Modeling Specialists, International (EMSI). The totality of data from these streams is presented in the following section. The following are select data points in this region for 2011:

•In comparison to the United States, the overall CVI<sup>™</sup> for the Seattle Metro Area increased slightly from 2.92 in 2010 to 2.93 in 2011.

•Non-profit arts organizations generated \$226 million in revenues, and non-profit arts-active organizations generated \$145.3 in income.

•The Seattle Metro Area had 329 non-profit arts and arts-active organizations.

•Independent artist revenues had \$233.1 million in revenues.

•When compared to the nation, the Seattle Metro Area had an index value of 4.55 in performing arts participation revenues.

## **Creative Vitality Report Details**

It is important to recall that the CVI<sup>™</sup> value of this region is always compared to a value of 1.00. While a region might not be at the 1.00 level, this does not indicate an absence of activity. Here, it can be useful to look at the relative strength of the categorical index values being examined. Additionally, looking at refined state and regional contexts can give valuable insight to how a "low performing" region might actually be contributing positively to a state and regional economy.

### A few key terms used in the CVI™

**Index**: summarizes multiple sources of data into a single indicator, using one number to describe a complex set of variables, activities, and events. A few of the best-known indexes are the Dow Jones Industrial Average, the Body Mass Index (BMI) and the Consumer Price Index (CPI).

**Per Capita**: most simply put, per capita means the average per person. In the context of the CVI<sup>™</sup>, per capita is referring to the ratio of the CVI<sup>™</sup> input--such as industry revenues, non-profit revenues, and jobs--to the number of people within the study area.

**CVI**<sup>™</sup>: a comparative indicator of a region's creative vitality, including non-profit and for-profit arts activities; it reflects the relative economic health of a region's creative economy.

**Arts Organizations**: organizations that have primary missions related to serving or presenting the arts. These organizations include traditionally subsidized arts organizations such as art museums, symphonies, operas, and ballets.

**Arts-Active Organizations**: organizations that do not have primary missions related to serving or presenting the arts, but do conduct a number of activities that can be considered "arts-based." For example, within any history museum, there is a significant amount of arts activities associated with exhibit design; the concept reflects a widely accepted trend in arts research to consider how certain creative activities and occupations that do not directly produce art, but are creative and artistic in nature, deserve recognition as vital parts of a creative economy.

**Location Quotient (LQ)**: an index value for each occupation, measuring whether or not there is a per capita concentration of an occupation within the area being measured; LQs are given for both the state and the nation, showing the relative concentration of employment for an area when compared with the state and with the nation. The location quotient approach is typically used in community analysis and planning to assess basic industries, or those exporting goods.

#### Seattle Metro Area Creative Vitality Index by Year

Table #1 and Chart #1 represent the total CVI<sup>™</sup> values for the aggregated zip codes within the Seattle Metro Area for the years 2010 and 2011. The 2010 overall CVI<sup>™</sup> value of 2.92 for the area increased slightly to 2.93 in 2011. Changes in index values should be considered alongside general local, regional, and national trends. The nature of the index accounts for both the influence of national trends and inflation by recalculating national comparison data in each year. This comparative mechanism also allows for an accurate description of local and regional trends while accounting for the influence of national changes. Sources for the variations of index values in each year experienced within the individual data streams are detailed further within this report.

		Table	#1		
Seattle	Metro	Area	CVI™	2010-	2011

Region	Index 2010	Index 2011
Seattle Me	2.92	2.93
Totals	2.92	2.93
Source: WESTA	١F	

#### Comparative CVI™ for 2010 and 2011

Table #2 and Chart #2 represent the total CVI<sup>™</sup> values for the Seattle Metro Area, Los Angeles County, San Francisco County, King County, Multnomah County, and Denver County for the years 2010 and 2011. San Francisco County had the top overall index value of 5.25 in 2011, while the Seattle Metro Area had the second highest CVI<sup>™</sup> value of 2.93. To view the CVI<sup>™</sup> values for all geographies included in this comparison, see Table #2.

A note on CVI<sup>™</sup> values: population density and regional sensitivity are important here. The CVI<sup>™</sup> measures the concentration of creative economic activities within a geographic area. While concentration rates, and thus index values, can be affected by changes in the size of the region being studied, CVI<sup>™</sup> values are not necessarily tied to population and population density. For example, some states with low population numbers, such as Alaska, Hawai'i, and Nevada, have high CVI<sup>™</sup> values when compared to states with much higher populations and urban concentrations. Conversely, areas with high populations or population densities do not consistently have high CVI<sup>™</sup> values. Certainly, the complexities of urban, suburban, and rural geographies and demographics play a role in the creativity and vibrancy of a region. The adjustable sensitivity of the CVI<sup>™</sup> to precise regions is a considerable strength of this measure.

## Table #2 Comparative CVI™ of Six Areas 2010-2011

Region	Index 2010	Index 2011
Seattle Metro A	2.92	2.93
Los Angeles	2.53	2.46
San Francisco	5.19	5.25
Denver	2.65	2.68
Multnomah	2.15	2.29
King	2.14	2.09
Totals	2.63	2.59

Chart #2 Comparative CVI™ of Six Areas 2010-2011

#### Seattle Metro Area CVI™ Values and Calculations vs. the United States 2011

Table #3 and Charts #3 through #4 provide the CVI<sup>™</sup> values for the Seattle Metro Area in comparison to the United States in 2011. The index value of the region increased slightly from 2.92 in 2010 to 2.93 in 2011. This area outperformed the United States in all categories measured by the CVI<sup>™</sup>, and non-profit arts organization revenue had the area's highest individual index value of 6.22 in 2011. This region had index values greater than 2.00 in six of the eight CVI<sup>™</sup> categories. Music store sales had the area's lowest 2011 individual index value of 1.38.

## Table #3 Seattle Metro Area CVI™ vs. the United States 2011

#### Seattle Metro Area CVI™ Values and Calculations vs. Western States 2011

Please see Table #5 and Charts #7 and #8 to view summarized CVI<sup>™</sup> data for the Seattle Metro Area in comparison to the Western States Region. The Western States Region includes Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. In 2011, the Seattle Metro Area surpassed the Western States Region in all eight categories measured by the CVI<sup>™</sup>, which contributed to a strong overall index value of 2.64. Photography store sales, performing arts participation revenues, non-profit arts organization revenues, non-profit arts-active organization revenues, and jobs linked to the creative economy all had individual index values above 2.00.

## Chart #6 Contributions to the CVI™ after Weighting Inputs 2011

#### Seattle Metro Area CVI™ Values and Calculations vs. Pacific Northwest 2011

A comparison of the Seattle Metro Area and the Pacific Northwest Region, which includes Oregon and Washington State, is shown in Table #4 and Charts #5 and #6. The Seattle Metro Area outperformed the Pacific Northwest Region in every CVI<sup>™</sup> category in 2011, which resulted in the above-average overall index value of 2.98 for the region. Non-profit arts organization revenues had the region's highest individual index value of 5.91, followed by performing arts participation revenues, and non-profit arts-active organization revenues.

## Table #5 Seattle Metro Area CVI™ vs. the Pacific Northwest 2011

Region A: Seattle Metro Area

Region B: Oregon, Washington

Description	Region A	Region B	Categorical Index
Year - 2011			
Population	831,998	10,698,692	
Industry Data			
Photography Store Sales	\$7,363,000	\$34,536,000	2.742
Music Store Sales	\$10,916,000	\$112,360,000	1.249
Book and Record Store Sales	\$37,009,000	\$328,819,000	1.447
Art Gallery and Individual Artist Sales	\$251,209,000	\$941,859,000	3.430

Chart #8 Contributions to the CVI™ after Weighting Inputs 2011

#### Seattle Metro Area CVI™ Values and Calculations vs. the State of Washington 2011

Detailed information regarding this comparison appears in Table #6 and Charts #9 and #10. In this comparison, the area had individual index values higher than 2.00 in six of the eight categories measured by the CVI<sup>™</sup>, and an overall CVI<sup>™</sup> value of 2.95 in 2011. Non-profit arts organization revenues had the area's highest individual index value in this comparison: 5.40.

## Table #6 Seattle Metro Area CVI™ vs. Washington 2011

Region A: Seattle Metro Area

Region B: Washington

Description	Region A	Region B	Categorical Index
Year - 2011			
Population	831,998	6,818,053	
Industry Data			
Photography Store Sales	\$7,363,000	\$19,911,000	3.030
Music Store Sales	\$10,916,000	\$70,657,000	1.266
Book and Record Store Sales	\$37,009,000	\$195,589,000	1.551

#### Seattle Metro Area CVI™ Values and Calculations vs. the Portland MSA 2011

CVI<sup>™</sup> data for this region in comparison to the Portland MSA is provided in Table #7 and Charts #11 and #12. The Seattle Metro Area surpassed the Portland MSA in seven of the eight categories measured by the CVI<sup>™</sup>. The area's music store sales had an index value only slightly below the national average: 0.99. Performing arts participation revenues and non-profit arts organization revenues had the region's two highest individual 2011 CVI<sup>™</sup> values in this comparison.

## Table #7 Seattle Metro Area CVI™ vs. the Portland MSA 2011

#### Seattle Metro Area CVI™ Values and Calculations vs. the Seattle MSA 2011

Table #8 and Charts #13 through #14 provide CVI<sup>™</sup> data for the Seattle Metro Area in comparison to the Seattle MSA. The Seattle MSA is comprised of King, Pierce, and Snohomish counties. In 2011, the area's overall index value was 2.04 in this comparison, and it outperformed the Seattle MSA in seven of the eight CVI<sup>™</sup> categories. The only category with a value below the national average in 2011 was music store sales at 0.99.

## Table #8 Seattle Metro Area CVI™ vs. the Seattle MSA 2011

Region A: Seattle Metro Area

## Chart #14 Contributions to the CV™ after Weighting Inputs 2011

#### The Occupational Index

The Occupational Index of the Arts measures the level of creative occupations per capita in a given geographic area compared with national per capita occupational employment. The CVI<sup>™</sup> measures 36 selected occupational categories that are highly correlated with measured skill sets in thinking creatively, originality, and fine arts knowledge as measured by the Employment and Training Administration's "O\*NET" occupational network database. Given this meticulous selection of occupations, the CVI<sup>™</sup> presents an extremely justifiable report on creative economy employment.

Location quotients (LQs) for each individual occupation are included within the CVI<sup>™</sup>. LQs are essentially the "index values" for each individual occupation, measuring whether or not there is a per capita concentration of an occupation within the study area. LQs are given for both the state and the nation, indicating the relative concentration of employment for an area when compared with the state and nation. The national standard LQ is "1.00." The strengths and weaknesses of occupational employment categories as measured by the LQ can provide important information about industry prevalence within a region's creative sector.

A note on the data used in this report: to provide the most accurate employment figures, Economic Modeling Specialists International (EMSI), a CVI<sup>™</sup> data partner, made enhancements to their ZIP code level occupational data between 2010 and 2011. EMSI uses the most current and reliable public and proprietary data sources, and incorporates these data sources into credible and accurate models. The following CVI<sup>™</sup> data sets were updated in 2011: Quarterly Census of Employment and Wages (QCEW-BLS), County Level Business Partners (Census), ZIP Code Business Patterns (Census), Nonemployer Statistics, and the Current Employment Statistics (BLS). These updates may cause some of occupations measured by the CVI<sup>™</sup> to show dramatic changes between 2010 and 2011. Perhaps the most significant data source update was made to the State Personal Income dataset from the Bureau of Economic Analysis. In many cases, EMSI uses state level data for ZIP code level employment information. This data is EMSI's primary source of noncovered employment totals--nonvested employees are individuals not covered by unemployment insurance. This update caused significant fluctuations in employment figures.

The highest-quality economic data is available no lower than at the ZIP code level. Economic data does exist below the ZIP code level (e.g. at the Census tract), but data at this level are susceptible to significant inaccuracies. The CVI<sup>™</sup> relies on nationally and longitudinally available data, and the ZIP code and county levels of measurement are available yearly and in all regions. Therefore, the CVI<sup>™</sup> measures the creative economy using ZIP codes or, in the case of Seattle, a collection of economically-related ZIP codes.

Changes in the data methodology partly explain variations in individual job categories, as displayed in Table #15. However, because these figures include part-time, sole and extended proprietors, and full-time workers, occupation totals fluctuate more dramatically than if only full-time jobs were being explored. Consider that a film company might hire artists to work on a project for one year in Seattle and that job does not exist the following year. Fluctuations in the individual categories are less telling than in the overall totals. In the case of Seattle, the total number of creative jobs increased seven percent, which is a normal, positive fluctuation for creative jobs in an area as creative as Seattle.

#### Seattle Metro Area Occupational Information 2011

Between 2010 and 2011, the Seattle Metro Area gained 2,039 jobs linked to the creative economy at a rate of 7.04%. The Seattle Metro Area had 30,998 creative jobs and an occupational index of 2.44 in 2011. The dramatic rise in jobs for graphic designers, musicians and singers, and radio and television announcers contributed to the overall increase of creative jobs within the region. Despite the area's overall gain in jobs within the creative economy, occupations such as set and exhibit designers, fashion designers, and music directors and composers lost jobs at a substantial rate. Dancers, sound engineering technicians, and camera operators were the three most highly concentrated occupations in the Seattle Metro Area when compared to the State of Washington in 2011.

#### Seattle Metro Area Non-Profit Arts and Arts-Active Organization Counts 2011

To view detailed information regarding the number of non-profit arts and arts-active organizations located in Seattle, see Table #9 and Charts #15 and #16. In 2011, there were 329 non-profit arts and arts-active organizations in the Seattle Metro Area. Theater organizations had the largest proportional share of arts organizations, followed by music and dance organizations. Cultural and ethnic awareness organizations made up the largest proportional share of the area's arts-active organizations in 2011.

# Table #12 Seattle Metro Area Non-Profit Arts and Arts-Active Organizations by Type 2011

#### Seattle Metro Area Non-Profit Arts Organization Revenue 2011

Arts organizations are generally qualified within the CVI<sup>™</sup> as organizations with a primary mission in presenting or serving media that are traditionally categorized as the arts. These types of organizations include the traditionally subsidized arts, such as visual arts museums, the symphony, the opera, the ballet and the theater. In 2011, \$226.2 million in revenues were generated by non-profit arts organizations within the metro area. The greatest proportion of these revenues came from program revenues, gifts, and contributions. The organization revenues measured within this study can be affected by the number of organizations reporting from year to year, categorization, and general reporting errors as submitted by individual agencies, disbursements of federal grants, and individual organizations' fundraising efforts, such as capital campaigns. Generally, these fluctuations occur throughout

non-profit revenue measurements across the nation as reported in this study. As a result, the annual index values provide a more informative indicator of an area's non-profit organization health than the total revenue figures. However, revenue figures as aggregated within this study provide a substantive approximation of dollar amounts going to non-profit arts organizations within a reporting period.

## Seattle Metro Area Non-Profit Arts-Active Organization Revenue 2011

Arts-active organizations are generally qualified within the CVI™ as organizations that do not have primary missions related to serving or presenting the arts, but do conduct a number of activities that can be considered "arts-based." For example, within any history museum, there is a significant amount of arts activity associated with exhibit design. Additionally, there are inherently close ties between humanities, culture, and arts organizations. Non-profit arts-active organizations generated \$145.3 in revenue within the Seattle Metro Area in 2011.

#### Technical Report and Understanding the CVI™

While the informational value of this report is immense, the potential benefit to arts advocacy, planning, and policy-making is equally great. In order to realize the practical value of this

research, it is important to review and consider the history of the CVI<sup>™</sup> and its differentiation from economic impact studies. Some suggestions for making use of the research are also presented here to encourage immediate application of the research. Finally, the sources of CVI<sup>™</sup> data are itemized to provide transparency of the research process.

## Developing the Creative Vitality<sup>™</sup> Index

The CVI<sup>™</sup> was developed in the context of innovations in cultural policy and economic development. The CVI<sup>™</sup> was initially conceived to help public sector arts agencies clearly communicate that their work encompasses a much larger segment of creative economic activity than had previously been the case. This was necessary because, beginning in the mid 1960s, when state arts agencies were established and city arts agencies were either founded or expanded, the primary focus of these entities was on the growth of the supply and quality of primarily non-profit-based arts activities.

These entities made great progress in this area. Once the supply and quality of non-profit arts activities was greatly bolstered, however, the public sector funders of the non-profit arts field began to consider how their goals and the work of the non-profit arts were part of a much larger creative system. They also became aware that the non-profit arts and public arts policy depended on the health of that larger system to survive in the present and thrive in the future.

Simultaneous with these developments, practitioners from fields representing for-profit creative activities and occupations began to discuss the creative economy in broad, highly inclusionary terms. The arts field and public sector arts funders embraced this broader concept as reflective of how they envisioned their work—as a stimulative part of an overall creative system and not simply as suppliers of funding to maintain a supply of non-profit-sourced arts opportunities. The CVI<sup>™</sup> reflects this broader systems-oriented thinking and reinforces the fact that the non-profit arts and public arts agencies are part of an interdependent whole called "the creative sector."

The CVI<sup>™</sup> grew out of a conversation about whether to undertake an economic impact study of the arts. The staff leadership of the Washington State Arts Commission and the Seattle Office of Arts & Cultural Affairs, in collaboration with others, explored ways to expand and enrich the economic argument for support of the arts and especially public funding of the arts. In doing so, the group was influenced by two national conversations concerning economic development: the defining of a creative economy and the outlining of the concept of economic development clusters. Those conversations did something the non-profit arts community was very late in doing—they included the related for-profit creative sector in a universe normally reserved for non-profits.

The public value work articulated by Mark Moore also played a role in the development of the CVI<sup>™</sup>. That work helped the public sector component of the non-profit arts funding community move away from a perspective oriented toward saving the arts to considering ways to be responsive to what citizens wanted in the arts. The approach also worked to shape agency deliverables to reflect their actual value to the public rather than the value arts aficionados considered them to have for the public. One result of this influence was that the CVI<sup>™</sup> was developed in a context of thinking in which individuals are assumed to have choices and that, to remain viable, public sector arts funders need to offer choices the public will value and thus select. In this concept of selection is the understanding that choice in the arts ranges outside the non-profit arts and that the public sector arts agency needs to ensure that such choice is available.

#### The Relationship of the CVI™ to Economic Impact Studies

Although it evolved from a discussion of whether to commission an economic impact study, the CVI<sup>™</sup> is not an economic impact study of the arts. Economic impact studies are

enumerations of the total economic value and impact of a specific basket of arts activities on the community, taking into account estimates of the ripple effect on jobs and revenues in other non-related industries. The majority of such studies focus on the non-profit art sector and either measure its impact exclusively or introduce measures of the impact of selected for-profit activities in a supplementary manner. The CVI<sup>™</sup> utilizes some of the data typically included in arts economic impact studies; however, it draws on many more data streams, and its goal is quite different in that it seeks to provide an indicator of the relative health of the economic elements of the creative economy.

Economic impact studies are rooted in advocacy and generally have as a core purpose the definition of the non-profit arts sector as a meaningful component of the larger economic system. The results of such studies are commonly used to argue for the allocation of scarce budget dollars to the arts because a dollar invested in the arts multiplies many times over and helps nurture a more robust overall economy. These studies have also been used to help the arts compete with other discretionary forms of government spending--and often these other interests have their own economic impact studies. The studies have been used most effectively to counteract the misguided notion that funds invested in the non-profit arts are removed from the economy and thus play no role in building or sustaining it.

Economic impact studies have also been commissioned to call attention to the size and scope of arts and culture as a component of the overall economic activity of an area. Often community leaders and the public are only familiar with one segment of the arts through their personal acquaintance with a single institution or discipline. The economic impact study aggregates information in ways that call attention to the size and scope of a cluster of endeavors that are often considered to be of minor importance in economic terms. As a result, the prestige of the arts and culture community in an area is enhanced, and the ability of the sector to be heard is often increased.

Although the CVI<sup>™</sup> can partially address each of the uses to which economic impact studies are employed, it has a different purpose. The CVI<sup>™</sup> is about exploring a complex set of relationships and changes in the dynamics of those relationships over time. It is not a replacement for economic impact studies, but can be a complement to them.

#### Making Use of the Creative Vitality<sup>™</sup> Index

The Creative Vitality<sup>™</sup> Index is designed to serve as a tool to inform public policy decision making and to support the work of advocates for the development of the creative economy. Here are some of the major uses of the CVI<sup>™</sup>: as a definitional tool, the index can be used to call attention to and educate the community at-large concerning the components and dynamics of the creative economy. Of particular significance is the promotion of the concept that the creative economy includes both the for-profit and the non-profit arts-related activities of an area. Many economic impact studies centered on the arts have focused almost entirely on the non-profit sector, and the inclusion of for-profit activities is, for many, a new conceptualization of the role of the arts in an economy. This approach locates all arts and arts-related creative activities in a continuum of creative activities.

The index can serve as a source of information for advocacy messaging. Individuals engaged in advocacy on behalf of the creative economy as a whole or elements of it can use the index to do some of the following:

Call the attention of the public to significant changes in the creative economy ecosystem. For example, if contributions from private foundations drop substantially in a year and three major architectural firms leave the area, advocates for a healthy creative economy can call attention to those factors as negative elements that will affect an overall ecosystem. Similarly, if non-profit arts groups at the same time experience increases in income from individuals and there are substantial increases in employment within other major creative

occupations such as graphic design and advertising, the negative impact of the events noted above may be cushioned or alleviated altogether.

Underscore the economic relationships between the for-profit sector and the non-profit sector and make the point that a healthy non-profit arts sector is important to the development of a healthy for-profit sector.

Advocate for improvements to the allocation of resources or the creation of policies that will increase the index values through the expansion of the role of a creative economy in a region.

Serve as a framework upon which to define and build a creative coalition. With the components of the index setting forth a vision for a creative community rather than a non-profit arts community, those who wish to build coalitions to influence change for the benefit of the development of the creative economy have a broader and deeper platform from which to begin the conversation.

Benchmark an area of endeavor and lay the groundwork for the improvement of one or more aspects of the creative economy. The index can serve as an initial diagnostic tool to create a baseline and then can be used to measure progress in that area. Elected officials and civic leaders can use the index as a starting point for discussing ways in which an area's local economy can be enriched through the development of the creative-economy segment of that community.

#### More on the CVI<sup>™</sup> Data Sources

Index data streams are analyzed by WESTAF and taken from two major data partners: the Urban Institute's National Center for Charitable Statistics and Economic Modeling Specialists, International (EMSI).

The Urban Institute's National Center for Charitable Statistics aggregates information from the Internal Revenue Service's 990 forms. The forms are required to be submitted by non-profit 501(c) organizations with annual gross receipts of \$25,000 or more. Organizations with more than \$25,000 but less than \$250,000 in annual gross receipts can file a 990 EZ form that collects less information. The CVI<sup>™</sup> uses the information contained in the 990 forms to identify changes in charitable giving in an area. These numbers are the best available but are not absolute. Some numbers may not be reported because of errors made in the completion of the form. These include nested fund transfers within larger fund allocations that include the arts in a significant way but are not broken out and/or the failure to capture data because an organization is either not required to file a 990 or does not file the full 990 form, thus limiting the level of data available.

Economic Modeling Specialists, International's (EMSI) expertise is centered on regional economics, data analysis, programming, and design so that it can provide the best available products and services for regional decision makers. In an effort to present the most complete possible picture of local economies, EMSI estimates jobs and earnings for all workers using Bureau of Labor Statistics data, data from the U.S. Bureau of Economic Analysis, and information from the U.S. Census Bureau. Because the number of non-covered workers in a given area can be large, job figures from EMSI will often be much larger than those in state LMI data. In order to estimate occupation employment numbers for a region, EMSI first calculates industry employment, then uses regionalized staffing patterns for every industry and applies the staffing patterns to the jobs by industry employment data in order to convert industries to occupations. EMSI bases occupation data on industry data because it is generally more reliable and is always published at the county level, whereas occupation data is only published by Occupational Employment Statistics (OES) region (usually 4-6 economically similar counties). Occupation employment data includes proprietors and self-employed

workers. EMSI uses nearly 90 federal, state and private sources including the U.S. Department of Commerce, the U.S. Department of Labor, The U.S. Department of Education, the U.S. Department of Housing and Urban Development, The U.S. Department of Health and Human Services, the U.S. Postal Service, and the Internal Revenue Service.
