Census

As a regional affiliate of the Washington State Data Center, PSRC maintains and makes available a range of U.S. Census Bureau data products for the central Puget Sound region.

Decennial Census

Selected data files—including demographic profiles, Summary File 1 (SF1) subject tables, Summary File 3 (SF3) characteristics reports, and redistricting data (P.L. 94-171) summary tables—from the U.S. decennial census for the region.

American Community Survey

American Community Survey (ACS) demographic profiles for the region.

Selected Social Characteristics in the United States: 2006-2008
Data Set: 2006-2008 American Community Survey 3-Year Estimates
Survey: American Community Survey
Geographic Area: Seattle-Tacoma-Bellevue, WA Metropolitan Statistical Area

NOTE. Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities and towns and estimates of housing units for states and counties. For more information on confidentiality protection, sampling error, nonsampling error, and definitions, see Survey Methodology.

Selected Social Characteristics in the United States	Estimate	Margin of Error (+/-)	Percent	Margin of Error (+/-)
HOUSEHOLDS BY TYPE				
Total households	**1,317,571**	**3,922**	**1,317,571**	**(X)**
Family households (families)	818,132	4,983	62.1%	0.3
With own children under 18 years	395,606	3,725	30.0%	0.3
Married-couple family	631,604	5,309	47.9%	0.4
With own children under 18 years	284,281	3,458	21.6%	0.3
Male householder, no wife present, family	58,384	2,401	4.4%	0.2
With own children under 18 years	30,912	1,729	2.3%	0.1
Female householder, no husband present, family	128,144	3,315	9.7%	0.3
With own children under 18 years	80,413	2,416	6.1%	0.2
Nonfamily households	499,439	4,982	37.9%	0.3
Householder living alone	393,695	5,129	29.9%	0.4
65 years and over	99,691	2,584	7.6%	0.2
Households with one or more people under 18 years	423,563	4,207	32.1%	0.3
Households with one or more people 65 years and over	244,811	2,106	18.6%	0.2
Average household size	2.45	0.01	(X)	(X)
Average family size	3.06	0.01	(X)	(X)

Three Important Things to Know About the ACS

One: It's about characteristics, not counts

The ACS is not a population count. Instead, it estimates the characteristics of a community based on a small sample of the population. It's useful for gauging trends over time or for comparing different areas, but should not be used to find out the size of the total population (or the number of Hispanics, speakers of Latvian, or households with incomes under $20,000) living in your city.

Two: Consider the margin of error

Fewer households are sampled for the ACS than for the Census long form. As a result, ACS estimates carry a larger amount of sampling error.' The Census Bureau informs people about the chance of error by publishing the margin of error (MOE) next to ACS estimates. The MOE is indicated with a "plus or minus" (+/-) sign, and is based on a 90 percent confidence interval. For example, the 2006 ACS estimate of the average income for Seattle residents was shown as $38,648. The MOE was +/- $1,392. That means the Census Bureau believes there was a 90 percent chance that the actual per capita income in Seattle was within plus or minus $1,392 of $38,648. The proportionally smaller the MOE is to the estimate, the more accurate the estimate is.

Three: Proceed with caution when making comparisons

Always use the same ACS estimate series when making comparisons. For example, let's say you want to compare Seattle to the smaller city of Bremerton. Bremerton has three-year estimates available, but Seattle has both three-year and one-year estimates. Which Seattle estimate should you use? The three-year estimate. One-year estimates shouldn't be compared with three-year estimates because the methodology used for producing the data sets is different. Comparing a one-year estimate to a three-year estimate is like comparing apples to oranges and may give you inaccurate results.

Which estimates do you use if you are analyzing a city or county that has both one-year estimates and multiyear estimates available? The answer depends on whether timeliness or accuracy is more important in your research. One-year estimates are more current and reflect annual trends better than multiyear estimates. But, three- and five-year estimates are based on a larger sample, and thus are more statistically reliable.

If you are doing trend analysis, also be aware of the following:

- Trends will not appear as clearly with multiyear estimates as they will with one-year estimates, due to

GIS and Maps

Map Catalog

Catalog of PSRC map products.

GIS Shapefiles

Index of GIS shapefiles, including census geographies and PSRC forecasting zones.

Equivalency Tables

Equivalency tables for correlating various geographic boundary systems (e.g. census tracts to TAZ, FAZ to TAZ).

Puget Sound LiDAR Consortium

Devoted to developing public domain high-resolution LiDAR topography for the Puget Sound region

WA-Trans: Washington State Transportation Framework

WSDOT-sponsored interagency collaboration to build a statewide transportation spatial data structure.

Data Systems and Analysis

The Data Systems and Analysis (DSA) Division administers a dat
of growth management, transportation and economic development planning in the central Puget Sound region. We develop and maintain regional planning data sets and deliver technical assistance to our member governments and organizations.
