## EXECUTIVE SUMMARY

Shannon & Wilson, Inc. has completed a Phase II Environmental Site Assessment (ESA) for the Port of Seattle's West Yard as part of the South Magnolia Combined Sewer Overflow Control Project. The subject property is located within the South Magnolia Basin, south of the Magnolia Bridge on 23<sup>rd</sup> Avenue West in Seattle, Washington. The objective of this Phase II ESA was to address recognized environmental concerns indentified in the 2011 Kleinfelder Phase I ESA and the 2004 Shannon & Wilson Hazardous Materials Discipline Report conducted for the Magnolia Bridge Replacement project, and to investigate the areas proposed for construction of the project storage tank facility site and associated utilities. The investigation was conducted for King County.

The objective of this Phase II ESA was to evaluate whether current or former on- and off-site activities have affected the subject property. The Phase II ESA scope of work was conducted in two phases and included soil sampling from twenty four (24) geoprobes and one geotechnical soil boring, the collection of nine groundwater samples from select geoprobes and a monitoring well installed in the geotechnical boring. In addition, one composite soil sample was collected from a soil stockpile located in the northwest corner of the property.

Soil samples collected from geoprobe borings, geotechnical boring, and soil stockpile were analyzed for petroleum hydrocarbons and metals. Near-surface soil samples collected from the geoprobe borings were analyzed for lead only. Select samples were also analyzed for volatile organic compounds (VOCs), polychlorinated biphenyls, and polycyclic aromatic hydrocarbon (PAHs). Groundwater samples collected from geoprobes and the monitoring well were analyzed for petroleum hydrocarbons, metals, and VOCs.

From this sampling, the following conclusions and recommendations can be drawn:

- A records review was performed to evaluate for potential sources of contamination. No specific sources of contamination were identified in any of the records reviewed during the investigation. Therefore, grid-wise sampling was performed with randomized placement of explorations.

- Petroleum hydrocarbons were detected in three widely distributed areas across the site at concentrations less than the Method A cleanup criterion of 2,000 mg/kg. Diesel-range hydrocarbons were detected in sample GP-14:SO2:7 at a concentration of 46 mg/kg. Lube oil-range hydrocarbons were detected in samples GP-16:7, GP-17:8, and MA-9:7 at concentrations of 4, 780, and 58 mg/kg, respectively. Residual-range hydrocarbons were also detected in sample MA-9:7 at concentration of 101 mg/kg. The distribution of the petroleum suggests multiple potential sources of contamination. Since detected concentrations are less than MTCA Method A cleanup criteria, no cleanup is warranted based up existing data.
- No staining or odors were observed in surface soil samples; therefore, they were only collected for lead analysis in each grid-wise exploration. Detected levels of lead in the samples were less than the MTCA Method A cleanup criteria and Washington State metals background concentrations for lead for the Puget Sound region.
- Low levels of contamination, including oil-range hydrocarbons and metals were detected in the composite sample collected from the soil stockpile. Although no constituent or combination of constituents exceeded a regulatory criteria, based on the presence of contamination, it is recommended that the soil be disposed of at a regulated landfill.
- Field screening results indicated petroleum contamination is present in the vicinity of GP-14. Step-out probes were completed to evaluate the potential source of the odors and elevated photoionization detector (PID) readings. Only a single step-out probe (GP-14:SO2) northeast of GP-14 manifested a significant indication of contamination.
- GP-14:7 and GP-14:SO2 were analyzed for diesel- and oil-range hydrocarbons and PAHs and GP-14:7 was also analyzed for VOCs. Diesel-range hydrocarbons were detected in GP-14:SO2 at a concentration less than the Method A cleanup criteria of 2,000 mg/kg. No diesel-range hydrocarbons were detected in sample GP-14:7. However, PAHs were present in both GP-14:7 and GP-14:SO2 at concentrations less than Method A cleanup criteria. Given the wide distribution of persistent petroleum odors and based on screening and analytical results, an additional investigation maybe warranted near GP-14:7 and GP-14:SO2 to determine if higher levels are present nearby.
- VOCs including acetone, carbon disulfide and 2-butanone were also detected in GP-14 at concentrations less than their respective Method B Non-carcinogenic criteria. The source of the contamination is not known; however, 2-butanone and carbon disulfide are frequently associated with landfills and occur naturally. Acetone is common cleaner but could also be a laboratory contaminant. Additional investigation of the volatiles is probably not warranted.
- Carbon disulfide was also detected in sample GP-2:16 at a concentration less than its MTCA Method B Non-carcinogenic criteria. The source of the contamination is not known; however, carbon disulfide is frequently associated with landfills and can occur naturally. No further investigation of this area is probably warranted.

- Oil-range hydrocarbons were detected in groundwater sample GP-11:GW at a concentration that exceeded the Method A cleanup criterion of 0.5 mg/L. In addition to the petroleum hydrocarbons, total lead and mercury were detected. Lead was detected at a concentration of 2,000 µg/L, well above its Method A cleanup criteria of 15 µg/L and mercury was detected at concentration of 5.2 µg/L above its Method A cleanup criterion of 2 µg/L. This type of contamination is suggestive of a waste oil release and, therefore, an additional investigation is probably warranted to determine if higher levels are present nearby. Soil did not exceed a regulatory criteria at this location.
- Total metal analysis for arsenic, and lead in groundwater derived from geoprobe borings exceeded Method A cleanup criteria in five of the nine samples. Total chromium exceeded its Method A cleanup criteria in four of the nine samples. However, the associated dissolved metals results did not exceed Method A cleanup criteria. Therefore, these elevated metals results are likely an artifact of sampling methodology and are not representative of widespread metals contamination in groundwater, with possibly the exception of lead in GP-11. As discussed above, the elevated lead detected in the groundwater in GP-11 may be associated with a waste oil release.
- Oil and its underlying constituents were also detected in samples collected from GP-16 and GP-17, however because of the low levels and nature of the contaminant an additional investigation does not appear warranted.
- Benzene was detected in the groundwater sample collected from monitoring well MA-9, which is screened at 36 feet below ground surface (bgs) to 46 feet bgs. The source of the benzene is not known but given its depth is likely associated with an off-site source. Since benzene was not detected elsewhere on site, an additional investigation is probably not warranted.

**SOUTH MAGNOLIA COMBINED SEWER OVERFLOW  
CONTROL PROJECT  
PHASE II ENVIRONMENTAL SITE ASSESSMENT  
SEATTLE, WASHINGTON**

**1.0 INTRODUCTION**

**1.1 Authorization**

Shannon & Wilson, Inc. has completed a Phase II Environmental Site Assessment (ESA) for the Port of Seattle's West Yard Site as part of the South Magnolia Combined Sewer Overflow (CSO) Control Project. The project site is located within the South Magnolia Basin, south of the Magnolia Bridge on 23<sup>rd</sup> Avenue West in Seattle, Washington, as shown in Figure 1. This investigation was performed in accordance with the scope of services for King County (KC) Contract E00223E11, authorized on September 27, 2011.

**1.2 Objective**

The work was conducted as part of the South Magnolia CSO Control Project on behalf of KC. The scope of services was developed to address recognized environmental concerns (RECs) identified in the Klienfelder Phase I ESA (Klienfelder, 2011) and the RECs relevant to this project identified in the Shannon & Wilson Hazardous Materials Discipline Study (Shannon & Wilson, 2004) conducted for the Magnolia Bridge Replacement project. The 2004 study identified properties to the north and west that store or have stored heating oil. As part of the South Magnolia CSO project this investigation was also used to evaluate the potential for soil and groundwater contamination in the areas proposed for construction of the storage tank facility. The scope of this investigation consisted of the following tasks:

- Obtain right of entries from the Port of Seattle.
- Advance twenty-four (24) geoprobe soil borings to collect soil samples for chemical analysis at the site. Five advanced within the proposed storage tank footprint, an additional twelve (12) advanced on a grid-wise basis across the site, and seven step-out borings advanced to evaluate potential contamination identified by screening.
- Collect eight (8) groundwater samples, two (2) from the geoprobe soil borings within the proposed storage tank footprint and six (6) from the additional the geoprobe borings across the site for chemical analysis.

- Collect two (2) soil samples from the geotechnical boring/monitoring well installed for the Phase I geotechnical investigation at the storage tank site for chemical analysis.
- Collect a groundwater sample from the monitoring well installed during the Phase 1 geotechnical investigation at the storage tank site for chemical analysis.
- Collect one composite soil sample from the soil stockpile located in the northwest corner of site.
- Coordinate the disposal of investigation-derived waste (IDW) generated by this investigation.
- Prepare this report.

## 2.0 BACKGROUND

### 2.1 Project Description

The proposed Magnolia CSO storage tank site is located within the Port of Seattle's (the Port's) West Yard. The site is currently being used by American Seafoods for storage of equipment. The Site is relatively flat and is bordered to the west by 23<sup>rd</sup> Avenue West, to the north by the existing Magnolia Bridge, to the east by Smith Cove and Puget Sound, and to the south by Smith Cove Park and Puget Sound. The existing ground surface elevation of the site is about 110 feet (KC Metro Datum). The site is developed with a combination of concrete-paved and gravel areas. No buildings are currently located on the site.

The Magnolia CSO Control project, when completed, will include a new conveyance pipeline and storage tank. The new conveyance pipeline will start at the existing diversion structure located on 32<sup>nd</sup> Avenue West and will terminate at the proposed storage tank located at the Port of Seattle's West Yard. In addition to the storage tank structure, there is a buried stilling basin and pump station facility and an aboveground ancillary building located at the southwest corner of the storage tank.

### 2.2 Historical Review and Findings

Starting in 1911, in association with the ship canal project, portions of the site were first filled in and developed. A review of historical aerial photographs and Sanborn Fire Insurance maps show the presence of structures on the site between 1930s and 1940s. Aerial photographs reviewed from 1936 and 1946 first show the presence of potential residential and commercial buildings and then, by 1946, the site was completely filled in, as it presently looks today, and was used as ball fields. No structures were present in the 1946 photograph. By 1940, the site was operated

by the Navy and used as recreation field until 1974, when it was sold to the Port, where it has been leased by entities at the Port for use as storage (Kleinfelder West, 2011). A further discussion of the historical review is included in draft Historical Investigation Report (Shannon & Wilson, 2012).

Findings of the Phase I ESA conducted by Kleinfelder West in 2011 identified poor housekeeping, including the presence of several 55-gallon drums labeled as containing potentially hazardous material, and an approximate 2,000 cubic yard of stockpiled soil as being a REC for the site. Additional relevant RECs were identified for the project in the Shannon & Wilson Hazardous Materials Discipline Study (Shannon & Wilson, 2004) conducted for the Magnolia Bridge Replacement project. The 2004 study identified properties to the north and west that store or have stored heating oil. These identified properties could have potentially impacted the site soil and/or groundwater.

### **3.0 GEOLOGY AND HYDROGEOLOGY**

#### **3.1 Geology**

Seattle is located in the central portion of the Puget Lowland, an elongated topographic and structural depression bordered by the Cascade Mountains on the east and the Olympic Mountains on the west. The lowland is characterized by a series of north-trending ridges separated by deep ravines and broad valleys. These ridges and valleys were formed by glacial scouring and sub-glacial erosion. In general, the ground surface elevation in the Puget Sound Region is within 500 feet of sea level.

The proposed project area is located within a north-south-trending topographic trough known as Interbay. The trough is bounded on both sides by glacial uplands, Magnolia on the west, and Queen Anne Hill on the east. The uplands are underlain by very dense and hard glacial soil laid down during the advance and retreat of several glaciations, whereas the intervening topographic swale/trough of Interbay is underlain by loose to dense glacial recessional outwash and beach deposits and very soft to stiff estuarine deposits laid down since the last retreat of glacial ice. Since the nineteenth century, various fill materials have been placed in the Interbay area, especially Smith Cove (Shannon & Wilson, 2004).

Soil observed in the subsurface explorations conducted during the Phase II ESA and geotechnical investigation generally consisted approximately 8 to 12 feet of loose artificial fill, consisting of slightly silty to silty, gravelly sand with scattered debris. The fill is underlain by about 6 to 11 feet of recent estuarine deposits and 22 to 34 feet of recent beach deposits. The

recent estuarine deposits consist of very soft, clayey silt to silty clay with scattered organic and shell fragments. The recent beach deposits consist of very loose to dense, silty, clayey gravel and slightly silty to silty gravel. The beach deposits are underlain by glacially overridden deposits of stiff to hard, silty clay to clayey silt at a depth of about 45 to 48 feet (elevation 62 to 65 feet).

### 3.2 Hydrogeology

The depth to the water table measured on the property during the Phase II ESA explorations and geotechnical investigation ranged from about 7.5 to 8 feet below ground surface (bgs). Based on topography of the site and the surrounding area, the local groundwater flow direction is likely to be to the south/southwest toward Smith Cove and Puget Sound. Since the site is directly adjacent to Smith Cove, the groundwater flow direction may fluctuate in response to tidal changes and other factors.

## 4.0 FIELD ACTIVITIES

Field activities were conducted during two phases. The initial phase was conducted from October 12 through 14, 2011, to investigate the area of the proposed CSO tank. The second phase was conducted on April 6 and 9, 2012, to investigate additional areas across the site.

During Phase 1 in October 2011, a total of five geoprobe soil borings (GP-1 through GP-5) were advanced within the proposed storage tank footprint by ESN Northwest of Olympia, Washington. In addition, two geotechnical borings, MA-8 and MA-9, were drilled in the southwest and southeast corners of the proposed storage tank footprint. Boring MA-8 was completed with a vibrating wire and MA-9 was completed as a monitoring well. Additional information regarding the geotechnical investigation and borings are discussed in a draft technical memorandum.

During Phase 2 in April 2012, a total of 12 geoprobe soil borings (GP-6 through GP-17), and seven step-out probes (SO-1 through SO-7) were advanced across the site by ESN Northwest. Locations of all the borings are shown in Figure 2.

The geoprobes borings were advanced using an AMS Powerprobe 9600 mounted on a Ford 550 series truck. The Powerprobe is a direct-push geoprobe rig with a 2-inch-outside diameter (O.D.) casing that is advanced using a percussive force, rather than an auger, to remove soils in its path. Geoprobe installation involved advancing the probe below the ground surface, then driving a 4-foot-long, 2-inch-O.D., plastic-lined sampler to retrieve a soil sample. The sampler

was then opened using a utility knife to expose the entire length of the sample and the soil is field screened for contamination using a photoionization detector (PID) and both visual and olfactory observations. Geoprobe samplers and associated sampling equipment were decontaminated between each geoprobe boring.

The two geotechnical borings were advanced using a mud-rotary drill rig. Soil samples were collected from the boring using a stainless steel spilt-spoon sampler equipped with a sample catcher. The samples were field screened for contamination using a PID and both visual and olfactory observations.

#### **4.1 Site Access and Utility Review**

Prior to the start of the Phase II investigation, utilities were cleared by reviewing available utility maps, notifying the public Washington Call-Before-You-Dig service, and subcontracting a private utility locating service. Site access was coordinated with the Port.

#### **4.2 Soil Sampling**

During the first phase of the investigation, geoprobe borings were advanced to a total depth of 20 feet bgs in five locations. A total of five soil samples were collected for analytical testing, one from each probe. The samples were collected from between 8 and 16.5 feet bgs. If no indication of contamination was encountered during the geoprobing, the soil sample was collected at the groundwater interface. Based on field screening including a detection of 22.5 parts per million (ppm) on the PID, one additional sample was collected in GP-2 at depth of 16.5 feet bgs. Because of the elevated PID readings, only the 16.5-foot sample from GP-2 was analyzed. The borings were advanced to 20 feet bgs in each location to provide additional information in support of the geotechnical review for the CSO Project.

Geotechnical borings MA-8 and MA-9 were drilled to a total depth of approximately 80 feet bgs using a mud-rotary drill rig. No field evidence of potential contamination was observed during the drilling, with the exception of two samples collected in boring MA-9 at 7 and 10 feet bgs near the water table. Field observations during drilling indicated that a slight hydrocarbon odor, along with an oily sheen, was present. Based on the observations soil samples were collected at 7 (MA-9:7) and 10 feet bgs (MA-9:10).

During the second phase of the investigation, a total of 12 geoprobe borings were advanced to an approximate total depth of 12 feet bgs. A total of 24 soil samples were collected for analytical testing, two from each boring. One soil sample was collected near the ground surface

(near-surface sample), at a depth of approximately 5 inches in each of the 12 locations during the geoprobing. A second soil sample was collected at the approximate groundwater interface. The second sample in each boring was collected between 6 and 9 feet bgs. PID readings taken during the course of the investigation ranged from 0.0 to 0.3 ppm, with the exception of one sample collected from geoprobe boring GP-14, which had a reading of 7.2 ppm.

Based on field screening, including an hydrocarbon odor and a detection of 7.2 ppm on the PID, seven step-out borings (SO-1 through SO-7) were advanced around geoprobe boring GP-14 to further evaluate the potential presence of contamination. Two soil samples were collected from each step-out geoprobe boring as described above. PID readings taken from the step-out geoprobe borings during sampling ranged from 0.1 ppm to the highest reading at 195 ppm in GP-14:SO2 at 7 feet. Based on the 195-ppm reading, the sample was analyzed.

All samples were collected using disposable sampling equipment and immediately placed into laboratory-supplied glassware. Each sample was identified with a unique sample number, immediately logged, stored in a cooler, and transported under proper chain-of-custody procedures to OnSite Environmental Inc. in Redmond, Washington, or Fremont Analytical in Seattle, Washington.

#### **4.3 Soil Stockpile Sampling**

During the second phase of the investigation, one composite soil sample (Stockpile Sample) was collected from the stockpiled soil located in the northwest corner of the site. Using a hand probe, soil borings were advanced on the stockpile in four locations to a depth of 5 feet below the top of the stockpile. The soil from each boring was placed and mixed in a stainless steel bowl. Prior to composting, the soil was screened for volatiles using a PID. Once all of the soil from the four borings was mixed together, one composite sample was collected using disposable sampling equipment and placed into laboratory-supplied glassware. The sample was stored in a cooler and transported under proper chain-of-custody procedures to OnSite Environmental, Inc.

#### **4.4 Groundwater Sampling**

A total of nine groundwater samples were collected during the first and second phases of the investigation at the site. Three samples were collected during the first phase and six samples were collected during the second phase. Groundwater samples were collected from the geoprobe borings (GP-2, -5, -6, -8, -11, -13, -14, and -16) and the monitoring well (MA-9) installed on the site in the geotechnical boring.

Groundwater was collected from geoprobe borings using temporary “micro-wells” or a mill-slotted groundwater sampler. Micro-wells consist of slotted  $\frac{3}{8}$ -inch polyethylene tubing attached to an anchor point. The anchor point was driven to depth with a probe rod and the tubing was run through the rod and threaded to the anchor point. The probe rod was then withdrawn from the well, leaving the tubing in place.

The mill-slotted groundwater sampler is a vertically slotted drill rod with a drive point at the end. The sampler was advanced to depth and allowed to fill with water. A  $\frac{3}{8}$ -inch polyethylene tube was then placed in the sampler for sampling. Once the sampler was in place, groundwater was withdrawn using  $\frac{3}{8}$ -inch polyethylene tubing attached to a peristaltic pump.

After installation of monitoring well MA-9, the well was developed and sampled. The well was developed using the pump and surge method, with a surge block and submersible pump. Development was considered completed when the entire screened interval had been surged and little to no sediment remained at the bottom of the well. Development water was drummed at the site.

Groundwater sampling was initiated at least 24 hours after well development was completed. A submersible pump was used to remove standing water so that a representative sample of the groundwater could be collected. Purging was completed when field parameters measured during the purge had stabilized. After purging was completed, the monitoring well was sampled using the submersible pump and disposable tubing. All purge and sampling water was drummed at the site.

Groundwater samples were collected in the geoprobe borings within the groundwater interface at approximately 7.5 and 9.0 feet bgs. The water sample collected from monitoring well MA-9 was collected at a depth of approximately 40 feet bgs. Upon collection, each sample was identified with a unique sample number, immediately logged, and stored in an ice filled cooler. Upon completion of the sampling, the samples were transported under proper chain-of-custody procedures to OnSite Environmental, Inc. in Redmond, Washington.

#### **4.5 Analytical Methods**

All of the geoprobe soil samples collected during the first phase of the investigation, were analyzed for Northwest Total Petroleum Hydrocarbons (NWTPH)-Hydrocarbon Identification (HCID) and Resource Conservation and Recovery Act (RCRA) 8 metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) by U.S. Environmental Protection Agency (EPA) Method 6000/7000 series. Based on field screening observations, soil sample

GP-2:16.5 was additionally analyzed for volatile organic compounds (VOCs) by EPA Method 8260.

Soil sample MA-9:7, collected from the geotechnical boring MA-9, was analyzed for gasoline-range hydrocarbons by the NWTPH Gasoline-Extended method, for diesel- and oil-range hydrocarbons by the NWTPH Diesel-Extended (Dx) method, for polychlorinated biphenyls (PCBs) by EPA Method 8082, and for RCRA 8 metals EPA Method 6000/7000 series. Soil sample MA-9:10 was only analyzed using the NWTPH-HCID method.

All of the geoprobe soil samples and one composite stockpile sample collected during the second phase of the investigation were analyzed for NWTPH-HCID, Model Toxics Control Act (MTCA) 5 Metals (arsenic, cadmium, chromium, lead, and mercury). The near-surface soil samples collected were only analyzed for total lead. Based on field screening and initial analytical results, select samples were also analyzed for polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8310, VOCs by EPA Method 8260, PCBs by EPA Method 8082, antimony and selenium by EPA Method 6010B, and diesel- and oil-range hydrocarbons by NWTPH-Dx method.

The groundwater samples collected during the first and second phases were analyzed for petroleum hydrocarbons by the NWTPH-HCID Method, VOCs by EPA Method 8260 and total and dissolved Priority Pollutant metals by EPA Methods 200.7, 6010, 245, 7470, and 7471. Based on the initial analytical results groundwater sample GP-11:GW was also analyzed for diesel- and oil-range hydrocarbons by NWTPH-Dx method.

## **4.6 Analytical Results**

Analytical results for the soil, stockpile, and groundwater samples collected during the Phase II ESA are discussed below. Tables 1, 2, 3, and 4, present summaries of results by various chemical groups for the soil and groundwater samples collected. A discussion of these data is provided in the following report sections. The analytical laboratory results for the collected samples are presented in Appendix B.

### **4.6.1 Soil Analytical Results**

No gasoline-range hydrocarbons were detected in any of the soil samples collected at the site during the investigation.

Diesel-range hydrocarbons were only detected in one sample, GP-14:SO-2:7, at a concentration of 46 milligrams per kilograms (mg/kg). The detected concentration is below its corresponding MTCA Method A cleanup criterion of 2,000 mg/kg.

Oil-range hydrocarbons were detected in two geoprobe boring soil samples, GP-16:7 and GP-17:8, at concentrations of 4 and 780 mg/kg, the composite stockpile soil sample at a concentration of 160 mg/kg, and geotechnical boring sample, MA-9:7, at a concentration of 58 mg/kg. In addition, residual-range hydrocarbons were also detected in MA-9:7 at a concentration of 101 mg/kg. All of the detected concentrations are below their corresponding MTCA Method A cleanup criterion of 2,000 mg/kg.

Lead was detected in 7 of the 12 near surface samples collected during the second phase of the investigation. The detected concentrations ranged from 6.3 mg/kg in GP-14:0.5 to 50 mg/kg in GP-11:0.5. The detected concentrations were well below the established MCTA Method A cleanup criterion of 250 mg/kg.

Lead was detected in 6 of the 18 soil samples collected at the groundwater interface during the first and second phase of the investigation. The detected concentrations ranged from 6.0 mg/kg in GP-16:7 to 77 mg/kg in GP-11:8. The detected concentrations are below leads established MTCA Method A cleanup criterion of 250 mg/kg.

Low concentrations of chromium were detected in all of the soil samples analyzed for metals. The detected chromium concentrations ranged from 21 mg/kg in GP-15:8 to 69 mg/kg in GP-7:8, below its Method A cleanup criterion of 2,000 mg/kg when plating is not a concern.

Low concentrations of barium were detected in all of the soil samples collected during the first phase of the investigation at concentrations ranging from 16 mg/kg in GP-2:16.5 to 43 mg/kg in GP-1:8. At present, the Washington State Department of Ecology (Ecology) does not have an established cleanup criterion for barium. However, the detected concentrations are well below the Washington State background metals concentration of 300 mg/kg for the Puget Sound Region.

No antimony was detected in either of the eight foot samples collected from GP-9 or GP-11.

No mercury was detected in any of the first- or second-phase soil samples analyzed for metals.

No selenium was detected in any of the first- or second-phase soil samples analyzed for metals.

No arsenic or cadmium was detected in any of the soil samples collected during the first or second phases of the investigation with the exception of the 7-foot sample collected from boring MA-9. Arsenic and cadmium were detected at concentrations of 3.65 and 0.274 mg/kg, respectively, below their representative Method A cleanup criteria of 20 and 2 mg/kg.

Silver was detected in only one of the soil sample collected during the first phase of the investigation. Silver was detected at a concentration of 0.0381 mg/kg in boring MA-9:7. The detected concentration is below Washington States metals background concentration of 0.61 mg/kg for the Puget Sound Region.

No PCBs were detected in the samples collected from borings MA-9 or GP-17 and/or the soil stockpile sample.

Acetone, carbon disulfide, and 2-butanone were detected in the 7-foot sample collected from boring GP-14 at concentrations of 0.022, 0.0022, and 0.0046 mg/kg, respectively. The detected concentrations are all below Ecology's MTCA Method B values for each individual analyte.

Carbon disulfide was the only VOC detected in sample GP-2:16.5; at a concentration of 0.0013 mg/kg which is below Ecology's MTCA Method B value of 8,000 mg/kg.

PAHs, including carcinogenic PAHs (cPAHs), were detected in three of the four samples where they were analyzed. However, none of these samples had detections that exceeded either the MTCA Method A residential and/or industrial use cleanup criteria of 0.1 mg/kg and/or 2 mg/kg for total cPAHs (Table 4).

Table 4 provides the toxicity equivalency factor (TEF) analysis of the individual cPAH constituents. The TEF method is used to adjust the concentrations of individual cPAHs such that they are relative in toxicity to benzo(a)pyrene, which is the most carcinogenic of the PAHs. The individual cPAH concentrations are then added together for comparison with the MTCA cleanup level for benzo(a)pyrene.

Soil analytical results are presented in Tables 1, 3, and 4.

#### 4.6.2 Stockpile Analytical Results

Metals including chromium and lead in the soil stockpile sample were detected at concentrations well below their individual Method A cleanup criteria. Lead was detected at a concentration of 33 mg/kg in the soil stockpile sample. No arsenic, cadmium, or mercury were detected in this sample.

No PCBs were detected in this sample.

Oil-range hydrocarbons were detected in the stockpile soil sample at a concentration of 160 mg/kg, below its corresponding MTCA Method A cleanup criterion of 2,000 mg/kg.

#### 4.6.3 Water Analytical Results

No petroleum hydrocarbons were detected in the groundwater samples collected from the geoprobe borings and monitoring well during the investigation, with the exception of the sample collected from GP-11. Lube oil was detected above the MTCA Method A cleanup criterion of 0.5 milligram per liter (mg/L) at a concentration of 1.3 mg/L.

Total arsenic was detected in seven of the nine groundwater samples collected. The detected concentrations, with the exception of one (MA-9), exceeded its Method A cleanup criterion of 5 micrograms per liter ( $\mu\text{g/L}$ ). Concentrations ranged from 4.6  $\mu\text{g/L}$  in MA-9 to 170  $\mu\text{g/L}$  in GP-11. Dissolved arsenic was detected in three of nine samples at concentrations ranging from 3.5  $\mu\text{g/L}$  in GP-16 to 4.3  $\mu\text{g/L}$  in MA-9, lower than the Method A criterion of 5  $\mu\text{g/L}$ .

Total chromium was detected in seven of the nine groundwater samples collected. The detected concentrations exceeded its Method A cleanup criterion of 50  $\mu\text{g/L}$  in four of the samples. Concentrations ranged from 170  $\mu\text{g/L}$  in GP-11 to a maximum of 350  $\mu\text{g/L}$  in GP-16.

Total lead was detected in seven of the nine groundwater samples collected. The detected concentrations exceeded the Method A cleanup criterion of 15  $\mu\text{g/L}$  in six of the samples. Concentrations ranged from 17  $\mu\text{g/L}$  in GP-6 to 2,000  $\mu\text{g/L}$  in GP-11. Dissolved lead was detected in the sample collected from GP-14 at a concentration of 7.7  $\mu\text{g/L}$ , well below its Method A criterion of 15  $\mu\text{g/L}$ .

Mercury (total) was detected in the groundwater sample collected from GP-11 at a concentration of 5.2  $\mu\text{g/L}$ . The detected concentration exceeds its Method A cleanup criterion of 2  $\mu\text{g/L}$ .

Total and dissolved antimony were detected in two of the nine groundwater samples collected. Antimony was detected at concentrations of 9.9 µg/L (total) and 11 µg/L (dissolved) in GP-5 and 13 µg/L (total) and 9.7 µg/L (dissolved) in GP-16. Total antimony was also detected in the sample collected from GP-11 at a concentration of 11 µg/L. The detected concentrations are greater than Ecology's Method B non-carcinogen standard formula value of 6.4 µg/L.

Total copper, nickel, and zinc were detected in samples collected from GP-6, GP-8, GP-11, GP-13, GP-14, and GP-16. The copper concentrations ranged from 20 µg/L in GP-14 to 760 µg/L in GP-11. The nickel concentrations ranged from 17 µg/L in GP-14 to 380 µg/L in GP-16 and the zinc concentrations ranged from 28 µg/L in GP-14 to 1300 µg/L in GP-11. Presently, Ecology has not established a Method A cleanup criterion for copper or nickel. The detected concentrations of zinc were less than Ecology's Method B non-carcinogen standard formula value of 4,800 µg/L.

No VOCs were detected in any of the groundwater samples collected from geoprobe borings and the monitoring well with the exception of benzene, carbon disulfide, and naphthalene. Benzene was detected in the groundwater sample from monitoring well MA-9 at a concentration of 0.22 µg/L, which is less than its Method A cleanup criterion of 5 µg/L. Carbon disulfide was detected in samples collected from GP-14 and GP-16 at concentrations of 0.31 µg/L in GP-14 and 0.24 µg/L in GP-16. Both of the detected concentrations are less than Ecology's Method B non-carcinogen value of 8,000 µg/L. Naphthalene was only detected in the sample collected from GP-16 at a concentration of 2.5 µg/L which is less than its Method A cleanup criterion of 160 µg/L.

Groundwater analytical results are presented in Table 2.

#### **4.7 Investigation-derived Waste (IDW)**

IDW, including soil cuttings and development/purge/rinse water generated during the first phase of field activities, was placed into 55-gallon drums, labeled, and temporarily stored on site. The drilling subcontractor, Boart Longyear of Fife, Washington, disposed of this material in accordance with applicable local, state, and federal regulations and permits on November 30, 2011.

IDW generated during the second phase of the investigation was placed into 15-gallon drums and temporarily stored onsite. The IDW is currently waiting for disposal. Available disposal documentation is contained in Appendix C.

## 5.0 CONCLUSIONS AND RECOMENDATIONS

Based on the above data, we offer the following conclusions and recommendations for the subject property.

- A records review was performed to evaluate for potential sources of contamination. No specific sources of contamination were identified in any of the records reviewed during the investigation. Therefore, grid-wise sampling was performed with randomized placement of explorations.
- Petroleum hydrocarbons were detected in three widely distributed areas across the site at concentrations less than the Method A cleanup criterion of 2,000 mg/kg. Diesel-range hydrocarbons were detected in sample GP-14:SO2:7 at a concentration of 46 mg/kg. Lube oil-range hydrocarbons were detected in samples GP-16:7, GP-17:8, and MA-9:7 at concentrations of 4, 780, and 58 mg/kg, respectively. Residual-range hydrocarbons were also detected in sample MA-9:7 at concentration of 101 mg/kg. The distribution of the petroleum suggests multiple potential sources of contamination. Since detected concentrations are less than MTCA Method A cleanup criteria, no cleanup is warranted based on existing data.
- No staining or odors were observed in surface soil samples; therefore, they were only collected for lead analysis in each grid-wise exploration. Detected levels of lead in the samples were less than the MTCA Method A cleanup criteria and Washington State metals background concentrations for lead for the Puget Sound region.
- Low levels of contamination, including oil-range hydrocarbons and metals were detected in the composite sample collected from the soil stockpile. Although no constituent or combination of constituents exceeded a regulatory criteria, based on the presence of contamination, it is recommended that the soil be disposed of at a regulated landfill.
- Field screening results indicated petroleum contamination is present in the vicinity of GP-14. Step-out probes were completed to evaluate the potential source of the odors and elevated photoionization detector (PID) readings. Only a single step-out probe (GP-14:SO2) northeast of GP-14 manifested a significant indication of contamination.

- GP-14:7 and GP-14:SO<sub>2</sub> were analyzed for diesel- and oil-range hydrocarbons and PAHs and GP-14:7 was also analyzed for VOCs. Diesel-range hydrocarbons were detected in GP-14:SO<sub>2</sub> at a concentration less than the Method A cleanup criteria of 2,000 mg/kg. No diesel-range hydrocarbons were detected in sample GP-14:7. However, PAHs were present in both GP-14:7 and GP-14:SO<sub>2</sub> at concentrations less than Method A cleanup criteria. Given the wide distribution of persistent petroleum odors and based on screening and analytical results, an additional investigation maybe warranted near GP-14:7 and GP-14:SO<sub>2</sub> to determine if higher levels are present nearby.
- VOCs including acetone, carbon disulfide and 2-butanone were also detected in GP-14 at concentrations less than their respective Method B Non-carcinogenic criteria. The source of the contamination is not known; however, 2-butanone and carbon disulfide are frequently associated with landfills and occur naturally. Acetone is common cleaner but could also be a laboratory contaminant. Additional investigation of the volatiles is probably not warranted.
- Carbon disulfide was also detected in sample GP-2:16 at a concentration less than its MTCA Method B Non-carcinogenic criteria. The source of the contamination is not known; however, carbon disulfide is frequently associated with landfills and can occur naturally. No further investigation of this area is probably warranted.
- Oil-range hydrocarbons were detected in groundwater sample GP-11:GW at a concentration that exceeded the Method A cleanup criterion of 0.5 mg/L. In addition to the petroleum hydrocarbons, total lead and mercury were detected. Lead was detected at a concentration of 2,000 µg/L, well above its Method A cleanup criteria of 15 µg/L and mercury was detected at concentration of 5.2 µg/L above its Method A cleanup criterion of 2 µg/L. This type of contamination is suggestive of a waste oil release and, therefore, an additional investigation is probably warranted to determine if higher levels are present nearby. Soil did not exceed a regulatory criteria at this location.
- Total metal analysis for arsenic, and lead in groundwater derived from geoprobe borings exceeded Method A cleanup criteria in five of the nine samples. Total chromium exceeded its Method A cleanup criteria in four of the nine samples. However, the associated dissolved metals results did not exceed Method A cleanup criteria. Therefore, these elevated metals results are likely an artifact of sampling methodology and are not representative of widespread metals contamination in groundwater, with possibly the exception of lead in GP-11. As discussed above, the elevated lead detected in the groundwater in GP-11 may be associated with a waste oil release.
- Oil and its underlying constituents were also detected in samples collected from GP-16 and GP-17, however because of the low levels and nature of the contaminant an additional investigation does not appear warranted.

- Benzene was detected in the groundwater sample collected from monitoring well MA-9, which is screened at 36 feet below ground surface (bgs) to 46 feet bgs. The source of the benzene is not known but given its depth is likely associated with an off-site source. Since benzene was not detected elsewhere on site, an additional investigation is probably not warranted.

## 6.0 LIMITATIONS

Within the limitations of scope, schedule, and budget, Shannon & Wilson has prepared this report in a professional manner, using that level of skill and care normally exercised for similar projects under similar conditions by reputable and competent environmental consultants currently practicing in this area.

The data presented in this report are based on limited research and sampling at the site and should be considered representative at the time of our observations. Other areas of contamination that were not obvious during our site work could be present at the site. Shannon & Wilson is not responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time the report was prepared. We also note that the facts and conditions referenced in this report may change over time and that the conclusions and recommendations set forth here are applicable to the facts and conditions as described only at the time of this report. We believe that the conclusions stated here are factual, but no guarantee is made or implied.

This report was prepared for the exclusive use of KC and Tetra Tech and their representatives, and in no way guarantees that any agency or its staff will reach the same conclusions as Shannon & Wilson. To help you and others in understanding the limitations of our report, Shannon & Wilson has prepared Appendix D, "Important Information About Your Geotechnical/Environmental Report."

<b>Sum<sup>(2)</sup></b>				<b>0.01</b>
MTCA Method A Cleanup Level for Unrestricted Land Use				0.100

Notes:

<sup>(1)</sup> Calculated as the detected concentration times the toxic equivalency factor (TEF), or as the method detection limit (if analyte is not detected) times the TEF.

<sup>(2)</sup> Sum of the TEF for each carcinogenic polycyclic aromatic hydrocarbon.

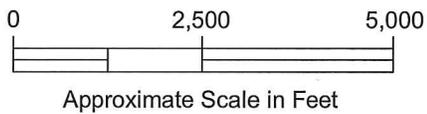

Shading indicates an exceedance of criteria.

cPAHs = carcinogenic polycyclic aromatic hydrocarbons

mg/kg = milligrams per kilogram

MTCA = Washington Model Toxics Control Act

ND = not detected

**APPENDIX A**  
**GEOPROBE AND BORING LOGS**

Draft

Shannon & Wilson, Inc. (S&W), uses a soil classification system modified from the Unified Soil Classification System (USCS). Elements of the USCS and other definitions are provided on this and the following page. Soil descriptions are based on visual-manual procedures (ASTM D 2488-93) unless otherwise noted.

### S&W CLASSIFICATION OF SOIL CONSTITUENTS

- MAJOR constituents compose more than 50 percent, by weight, of the soil. Major constituents are capitalized (i.e., SAND).
- Minor constituents compose 12 to 50 percent of the soil and precede the major constituents (i.e., silty SAND). Minor constituents preceded by "slightly" compose 5 to 12 percent of the soil (i.e., slightly silty SAND).
- Trace constituents compose 0 to 5 percent of the soil (i.e., slightly silty SAND, trace of gravel).

### MOISTURE CONTENT DEFINITIONS

Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, from below water table

### ABBREVIATIONS

ATD	At Time of Drilling
Elev.	Elevation
ft	feet
FeO	Iron Oxide
MgO	Magnesium Oxide
HSA	Hollow Stem Auger
ID	Inside Diameter
in	inches
lbs	pounds
Mon.	Monument cover
N	Blows for last two 6-inch increments
NA	Not applicable or not available
NP	Non plastic
OD	Outside diameter
OVA	Organic vapor analyzer
PID	Photo-ionization detector
ppm	parts per million
PVC	Polyvinyl Chloride
SS	Split spoon sampler
SPT	Standard penetration test
USC	Unified soil classification
WOH	Weight of hammer
WOR	Weight of drill rods
WLI	Water level indicator

### GRAIN SIZE DEFINITION

DESCRIPTION	SIEVE NUMBER AND/OR SIZE
FINES	< #200 (0.08 mm)
SAND* - Fine - Medium - Coarse	#200 to #40 (0.08 to 0.4 mm) #40 to #10 (0.4 to 2 mm) #10 to #4 (2 to 5 mm)
GRAVEL* - Fine - Coarse	#4 to 3/4 inch (5 to 19 mm) 3/4 to 3 inches (19 to 76 mm)
COBBLES	3 to 12 inches (76 to 305 mm)
BOULDERS	> 12 inches (305 mm)

\* Unless otherwise noted, sand and gravel, when present, range from fine to coarse in grain size.

### RELATIVE DENSITY / CONSISTENCY

COARSE-GRAINED SOILS		FINE-GRAINED SOILS	
N, SPT, BLOWS/FT.	RELATIVE DENSITY	N, SPT, BLOWS/FT.	RELATIVE CONSISTENCY
0 - 4	Very loose	Under 2	Very soft
4 - 10	Loose	2 - 4	Soft
10 - 30	Medium dense	4 - 8	Medium stiff
30 - 50	Dense	8 - 15	Stiff
Over 50	Very dense	15 - 30	Very stiff
		Over 30	Hard

### WELL AND OTHER SYMBOLS

	Bent. Cement Grout		Surface Cement Seal
	Bentonite Grout		Asphalt or Cap
	Bentonite Chips		Slough
	Silica Sand		Bedrock
	PVC Screen		
	Vibrating Wire

## SOIL CLASSIFICATION AND LOG KEY

January 2012

21-1-21623-015

**SHANNON & WILSON, INC.**  
Geotechnical and Environmental Consultants

**FIG. A-1**  
Sheet 1 of 2

**UNIFIED SOIL CLASSIFICATION SYSTEM (USCS)**  
(From USACE Tech Memo 3-357)

MAJOR DIVISIONS			GROUP/GRAPHIC SYMBOL	TYPICAL DESCRIPTION	
COARSE-GRAINED SOILS (more than 50% retained on No. 200 sieve)	Gravels (more than 50% of coarse fraction retained on No. 4 sieve)	Clean Gravels (less than 5% fines)	GW		Well-graded gravels, gravels, gravel/sand mixtures, little or no fines.
			GP		Poorly graded gravels, gravel-sand mixtures, little or no fines
		Gravels with Fines (more than 12% fines)	GM		Silty gravels, gravel-sand-silt mixtures
			GC		Clayey gravels, gravel-sand-clay mixtures
	Sands (50% or more of coarse fraction passes the No. 4 sieve)	Clean Sands (less than 5% fines)	SW		Well-graded sands, gravelly sands, little or no fines
			SP		Poorly graded sand, gravelly sands, little or no fines
		Sands with Fines (more than 12% fines)	SM		Silty sands, sand-silt mixtures
			SC		Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (50% or more passes the No. 200 sieve)	Silt and Clays (liquid limit less than 50)	Inorganic	ML		Inorganic silts of low to medium plasticity, rock flour, sandy silts, gravelly silts, or clayey silts with slight plasticity
			CL		Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		Organic	OL		Organic silts and organic silty clays of low plasticity
	Silt and Clays (liquid limit 50 or more)	Inorganic	MH		Inorganic silts, micaceous or diatomaceous fine sands or silty soils, elastic silt
			CH		Inorganic clays of medium to high plasticity, sandy fat clay, or gravelly fat clay
		Organic	OH		Organic clays of medium to high plasticity, organic silts
HIGHLY-ORGANIC SOILS	Primarily organic matter, dark in color, and organic odor	PT		Peat, humus, swamp soils with high organic content (see ASTM D 4427)	

NOTE: No. 4 size = 5 mm; No. 200 size = 0.075 mm

**DRAFT**

NOTES

- Dual symbols (symbols separated by a hyphen, i.e., SP-SM, slightly silty fine SAND) are used for soils with between 5% and 12% fines or when the liquid limit and plasticity index values plot in the CL-ML area of the plasticity chart.
- Borderline symbols (symbols separated by a slash, i.e., CL/ML, silty CLAY/clayey SILT; GW/SW, sandy GRAVEL/gravelly SAND) indicate that the soil may fall into one of two possible basic groups.

### NOTES

1. In some cases where recovery was low in the upper part of the run, the soil sample may have slid down in the tube prior to removal from the ground.
2. Groundwater level, if indicated above, was estimated during probing and should be considered approximate.
3. Refer to KEY for definitions and explanation of symbols.
4. CT = corrosion test sample; TR = thermal resistivity sample; EN = environmental sample; GE = geotechnical sample; AR = archeological sample.

Re: Analytical Data for Project 21-1-21623-016  
Laboratory Reference No. 1110-105

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on October 14, 2011.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Baumeister", with a long horizontal flourish extending to the right.

David Baumeister  
Project Manager

Enclosures

Date of Report: October 21, 2011  
Samples Submitted: October 14, 2011  
Laboratory Reference: 1110-105  
Project: 21-1-21623-016

### Case Narrative

Samples were collected on October 13, 2011 and received by the laboratory on October 14, 2011. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

#### Volatiles (soil) EPA 8260B Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

### Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical \_\_\_\_\_.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- Y - Sample extract treated with an acid/silica gel cleanup procedure.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project 21-1-21623-016  
Laboratory Reference No. 1111-048

Dear Paul:

Enclosed are the analytical results and associated quality control data for samples submitted on November 7, 2011.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DEB", with a long horizontal flourish extending to the right.

David Baumeister  
Project Manager

Enclosures

Date of Report: November 15, 2011  
Samples Submitted: November 7, 2011  
Laboratory Reference: 1111-048  
Project: 21-1-21623-016

### **Case Narrative**

Samples were collected on November 7, 2011 and received by the laboratory on November 7, 2011. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

### Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical \_\_\_\_\_.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- Y - Sample extract treated with an acid/silica gel cleanup procedure.
- Z -
- ND - Not Detected at PQL  
 PQL - Practical Quantitation Limit  
 RPD - Relative Percent Difference

Seattle, Washington 98103

**RE: Magnolia CSO**

**Lab ID: 1110054**

October 19, 2011

**Attention Paul Van Horne:**

Fremont Analytical, Inc. received 2 sample(s) on 10/14/2011 for the analyses presented in the following report.

***Hydrocarbon Identification by NWTPH-HCID***

***Mercury by EPA Method 7471***

***pH by EPA Method 9045***

***Total Metals by EPA Method 6020***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

A handwritten signature in black ink, appearing to read "M. Dee".

Michael Dee  
Sr. Chemist / Principal

Date: 10/19/2011

## Work Order Sample Summary

---

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received
1110054-001	MA-3:190:PH	10/13/2011 10:45 AM	10/14/2011 11:24 AM
1110054-002	MA-8:0:C	10/13/2011 9:35 AM	10/14/2011 11:24 AM

---

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

**CLIENT:** Shannon & Wilson

**Project:** Magnolia CSO

---

**I. SAMPLE RECEIPT:**

All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

**II. GENERAL REPORTING COMMENTS:**

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

**III. ANALYSES AND EXCEPTIONS:**

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

**Client:** Shannon & Wilson

Client Name: **SW**

 Work Order Number: **1110054**

 Logged by: **Troy Zehr**

 Date Received: **10/14/2011 11:24:00 AM**
**Chain of Custody**

1. Were custodial seals intact? Yes  No  Not Present
2. Is Chain of Custody complete? Yes  No  Not Present
3. How was the sample delivered? Client

**Log In**

4. Coolers are present? Yes  No  NA
5. Was an attempt made to cool the samples? Yes  No  NA
6. Were all coolers received at a temperature of >0° C to 10.0°C Yes  No  NA
7. Sample(s) in proper container(s)? Yes  No
8. Sufficient sample volume for indicated test(s)? Yes  No
9. Are samples properly preserved? Yes  No
10. Was preservative added to bottles? Yes  No  NA
11. Is there headspace present in VOA vials? Yes  No  No VOA Vials
12. Did all sample containers arrive in good condition?(unbroken) Yes  No
13. Does paperwork match bottle labels? Yes  No
14. Are matrices correctly identified on Chain of Custody? Yes  No
15. Is it clear what analyses were requested? Yes  No
16. Were all holding times able to be met? Yes  No

**Special Handling (if applicable)**

17. Was client notified of all discrepancies with this order? Yes  No  NA

**Shannon & Wilson**

Paul Van Horne  
400 N. 34th Street, Suite 100  
Seattle, Washington 98103

**RE: Magnolia CSO**

**Lab ID: 1110057**

October 19, 2011

**Attention Paul Van Horne:**

Fremont Analytical, Inc. received 4 sample(s) on 10/14/2011 for the analyses presented in the following report.

***Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.***

***Gasoline by NWTPH-Gx***

***Hydrocarbon Identification by NWTPH-HCID***

***Mercury by EPA Method 7471***

***pH by EPA Method 9045***

***Polychlorinated Biphenyls (PCB) by EPA 8082***

***Total Metals by EPA Method 6020***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

A handwritten signature in black ink, appearing to read "M. Dee", is written over a light blue horizontal line.

Michael Dee  
Sr. Chemist / Principal

Date: 10/19/2011

---

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

**CLIENT:** Shannon & Wilson**Project:** Magnolia CSO

---

**I. SAMPLE RECEIPT:**

All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

**II. GENERAL REPORTING COMMENTS:**

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

**III. ANALYSES AND EXCEPTIONS:**

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Analytical Comments for METHOD O-DXEX-S, SAMPLE 1110057-001A, Batch ID 1278: Received silica-gel treatment

### Chain of Custody

1. Were custodial seals intact? Yes  No  Not Present
2. Is Chain of Custody complete? Yes  No  Not Present
3. How was the sample delivered? Client

### Log In

4. Coolers are present? Yes  No  NA
5. Was an attempt made to cool the samples? Yes  No  NA
6. Were all coolers received at a temperature of >0° C to 10.0°C Yes  No  NA
7. Sample(s) in proper container(s)? Yes  No
8. Sufficient sample volume for indicated test(s)? Yes  No
9. Are samples properly preserved? Yes  No
10. Was preservative added to bottles? Yes  No  NA
11. Is there headspace present in VOA vials? Yes  No  No VOA Vials
12. Did all sample containers arrive in good condition?(unbroken) Yes  No
13. Does paperwork match bottle labels? Yes  No
14. Are matrices correctly identified on Chain of Custody? Yes  No
15. Is it clear what analyses were requested? Yes  No
16. Were all holding times able to be met? Yes  No

### Special Handling (if applicable)

17. Was client notified of all discrepancies with this order? Yes  No  NA

Re: Analytical Data for Project 21-1-21623-016  
Laboratory Reference No. 1204-041

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on April 7, 2012.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister  
Project Manager

Enclosures

Date of Report: April 17, 2012  
Samples Submitted: April 7, 2012  
Laboratory Reference: 1204-041  
Project: 21-1-21623-016

### **Case Narrative**

Samples were collected on April 6 and 7, 2012 and received by the laboratory on April 7, 2012. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

#### Volatiles EPA 8260B (soil) Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

### Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical \_\_\_\_\_.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- Y - Sample extract treated with an acid/silica gel cleanup procedure.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project 21-1-21623-016  
Laboratory Reference No. 1204-041B

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on April 7, 2012.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister  
Project Manager

Enclosures

Date of Report: April 30, 2012  
Samples Submitted: April 7, 2012  
Laboratory Reference: 1204-041B  
Project: 21-1-21623-016

### **Case Narrative**

Samples were collected on April 6, 2012 and received by the laboratory on April 7, 2012. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Re: Analytical Data for Project 21-1-21623-016  
Laboratory Reference No. 1204-055

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on April 9, 2012.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Baumeister", with a long horizontal flourish extending to the right.

David Baumeister  
Project Manager

Enclosures

Date of Report: April 19, 2012  
Samples Submitted: April 9, 2012  
Laboratory Reference: 1204-055  
Project: 21-1-21623-016

### **Case Narrative**

Samples were collected on April 9, 2012 and received by the laboratory on April 9, 2012. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

#### NWTPH Gx/BTEX Analysis

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

### Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical \_\_\_\_\_.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- Y - Sample extract treated with an acid/silica gel cleanup procedure.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project 21-1-21623-016  
Laboratory Reference No. 1204-123

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on April 19, 2012.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister  
Project Manager

Enclosures

Date of Report: April 26, 2012  
Samples Submitted: April 19, 2012  
Laboratory Reference: 1204-123  
Project: 21-1-21623-016

### Case Narrative

Samples were collected on April 19, 2012 and received by the laboratory on April 19, 2012. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

#### NWTPH Gx (water) Analysis

The gasoline result for sample GP-21:GW is mainly attributed to a single peak (Naphthalene).

#### Volatiles EPA 8260B (water) Analysis

Some MTCA Method A cleanup levels are non-achievable for sample GP-21:GW due to the necessary dilution of the sample.

**Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.**

### Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical \_\_\_\_\_.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- Y - Sample extract treated with an acid/silica gel cleanup procedure.
- Z - The gasoline result is mainly attributed to a single peak (Naphthalene).
- ND - Not Detected at PQL  
 PQL - Practical Quantitation Limit  
 RPD - Relative Percent Difference

**APPENDIX D**  
**IMPORTANT INFORMATION ABOUT**  
**YOUR GEOTECHNICAL/ENVIRONMENTAL REPORT**

Draft

Date: May 11, 2012  
To: Mr. Jeff Lykken  
Tetra Tech

## **IMPORTANT INFORMATION ABOUT YOUR GEOTECHNICAL/ENVIRONMENTAL REPORT**

### **CONSULTING SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES AND FOR SPECIFIC CLIENTS.**

Consultants prepare reports to meet the specific needs of specific individuals. A report prepared for a civil engineer may not be adequate for a construction contractor or even another civil engineer. Unless indicated otherwise, your consultant prepared your report expressly for you and expressly for the purposes you indicated. No one other than you should apply this report for its intended purpose without first conferring with the consultant. No party should apply this report for any purpose other than that originally contemplated without first conferring with the consultant.

### **THE CONSULTANT'S REPORT IS BASED ON PROJECT-SPECIFIC FACTORS.**

A geotechnical/environmental report is based on a subsurface exploration plan designed to consider a unique set of project-specific factors. Depending on the project, these may include: the general nature of the structure and property involved; its size and configuration; its historical use and practice; the location of the structure on the site and its orientation; other improvements such as access roads, parking lots, and underground utilities; and the additional risk created by scope-of-service limitations imposed by the client. To help avoid costly problems, ask the consultant to evaluate how any factors that change subsequent to the date of the report may affect the recommendations. Unless your consultant indicates otherwise, your report should not be used: (1) when the nature of the proposed project is changed (for example, if an office building will be erected instead of a parking garage, or if a refrigerated warehouse will be built instead of an unrefrigerated one, or chemicals are discovered on or near the site); (2) when the size, elevation, or configuration of the proposed project is altered; (3) when the location or orientation of the proposed project is modified; (4) when there is a change of ownership; or (5) for application to an adjacent site. Consultants cannot accept responsibility for problems that may occur if they are not consulted after factors which were considered in the development of the report have changed.

### **SUBSURFACE CONDITIONS CAN CHANGE.**

Subsurface conditions may be affected as a result of natural processes or human activity. Because a geotechnical/environmental report is based on conditions that existed at the time of subsurface exploration, construction decisions should not be based on a report whose adequacy may have been affected by time. Ask the consultant to advise if additional tests are desirable before construction starts; for example, groundwater conditions commonly vary seasonally.

Construction operations at or adjacent to the site and natural events such as floods, earthquakes, or groundwater fluctuations may also affect subsurface conditions and, thus, the continuing adequacy of a geotechnical/environmental report. The consultant should be kept apprised of any such events, and should be consulted to determine if additional tests are necessary.

### **MOST RECOMMENDATIONS ARE PROFESSIONAL JUDGMENTS.**

Site exploration and testing identifies actual surface and subsurface conditions only at those points where samples are taken. The data were extrapolated by your consultant, who then applied judgment to render an opinion about overall subsurface conditions. The actual interface between materials may be far more gradual or abrupt than your report indicates. Actual conditions in areas not sampled may differ from those predicted in your report. While nothing can be done to prevent such situations, you and your consultant can work together to help reduce their impacts. Retaining your consultant to observe subsurface construction operations can be particularly beneficial in this respect.

### **A REPORT'S CONCLUSIONS ARE PRELIMINARY.**

The conclusions contained in your consultant's report are preliminary because they must be based on the assumption that conditions revealed through selective exploratory sampling are indicative of actual conditions throughout a site. Actual subsurface conditions can be discerned only during earthwork; therefore, you should retain your consultant to observe actual conditions and to provide conclusions. Only the consultant who prepared the report is fully familiar with the background information needed to determine whether or not the report's recommendations based on those conclusions are valid and whether or not the contractor is abiding by applicable recommendations. The consultant who developed your report cannot assume responsibility or liability for the adequacy of the report's recommendations if another party is retained to observe construction.

### **THE CONSULTANT'S REPORT IS SUBJECT TO MISINTERPRETATION.**

Costly problems can occur when other design professionals develop their plans based on misinterpretation of a geotechnical/environmental report. To help avoid these problems, the consultant should be retained to work with other project design professionals to explain relevant geotechnical, geological, hydrogeological, and environmental findings, and to review the adequacy of their plans and specifications relative to these issues.

### **BORING LOGS AND/OR MONITORING WELL DATA SHOULD NOT BE SEPARATED FROM THE REPORT.**

Final boring logs developed by the consultant are based upon interpretation of field logs (assembled by site personnel), field test results, and laboratory and/or office evaluation of field samples and data. Only final boring logs and data are customarily included in geotechnical/environmental reports. These final logs should not, under any circumstances, be redrawn for inclusion in architectural or other design drawings, because drafters may commit errors or omissions in the transfer process.

To reduce the likelihood of boring log or monitoring well misinterpretation, contractors should be given ready access to the complete geotechnical engineering/environmental report prepared or authorized for their use. If access is provided only to the report prepared for you, you should advise contractors of the report's limitations, assuming that a contractor was not one of the specific persons for whom the report was prepared, and that developing construction cost estimates was not one of the specific purposes for which it was prepared. While a contractor may gain important knowledge from a report prepared for another party, the contractor should discuss the report with your consultant and perform the additional or alternative work believed necessary to obtain the data specifically appropriate for construction cost estimating purposes. Some clients hold the mistaken impression that simply disclaiming responsibility for the accuracy of subsurface information always insulates them from attendant liability. Providing the best available information to contractors helps prevent costly construction problems and the adversarial attitudes that aggravate them to a disproportionate scale.

### **READ RESPONSIBILITY CLAUSES CLOSELY.**

Because geotechnical/environmental engineering is based extensively on judgment and opinion, it is far less exact than other design disciplines. This situation has resulted in wholly unwarranted claims being lodged against consultants. To help prevent this problem, consultants have developed a number of clauses for use in their contracts, reports and other documents. These responsibility clauses are not exculpatory clauses designed to transfer the consultant's liabilities to other parties; rather, they are definitive clauses that identify where the consultant's responsibilities begin and end. Their use helps all parties involved recognize their individual responsibilities and take appropriate action. Some of these definitive clauses are likely to appear in your report, and you are encouraged to read them closely. Your consultant will be pleased to give full and frank answers to your questions.

The preceding paragraphs are based on information provided by the  
ASFE/Association of Engineering Firms Practicing in the Geosciences, Silver Spring, Maryland
