

**The December 2001 Preliminary Storm Drainage Report for the project identifies a total project area of 144 acres. This figure is smaller than the 153.3-acre figure cited throughout the EIS as the area within the project limits. The difference in acreage is primarily due to the late addition of the enlarged NE 65<sup>th</sup> Street corridor, including an existing wetland near the entry to the project site, to scope of the drainage consultant's study. The drainage report addressed these areas and included corresponding calculations for them as "off-site basins" contributing drainage to the project site, while quantities for the enlarged 153-acre project site are reported in the EIS. The assessments, conclusions and project plans presented in the drainage report account for drainage from the entire 153 acres, and are not affected by virtue of treating some of the project site as off-site contributing area.**
