

## Memorandum

*To: Josh Shippy, Seattle Department of Transportation (SDOT)*

*From: Thaddeus Wozniak*

*Date: October 1, 2018*

*Subject: Updated Madison Street Corridor Bus Rapid Transit Project Vissim and Synchro results (based on the Project Development design as of March 20, 2018)*

This technical memorandum details the updated and new results of the traffic operations analysis for the Madison Street Corridor Bus Rapid Transit (BRT) Project. The design analyzed in this memo is based on the Project Development design as of March 20, 2018 (hereafter referred to as the 2018 PD design). The revised results from the Synchro intersection operation and Vissim microsimulation analyses are based on changes made to the project design and traffic signal adjustments since previous analyses were conducted in March 2017 reflecting the Project Development design as of January 27, 2017 (hereafter referred to as the 2017 PD design).

The purpose of this analysis is to establish an understanding of anticipated changes in the levels of service for intersection operations and of expected travel times and speeds for general traffic as well as for the BRT service upon implementation of the project. As part of the updates, a revised build conditions analysis was conducted for the AM and PM peak hours and compared to the existing, no-build, and the 2017 PD Design<sup>1</sup>.

The revised AM and PM peak hour analysis is based on the Synchro and Vissim models that were developed as part of prior analysis conducted in March 2017. The following updates were included to the design plans in the revised analysis.

- Intersection design modifications at 10<sup>th</sup> Avenue/Madison Street, 11<sup>th</sup> Avenue/Madison Street, and 14<sup>th</sup> Avenue/Madison Street intersections,
- Signal phasing changes at 9<sup>th</sup> Avenue/Spring Street, 12<sup>th</sup> Avenue/Madison Street, and 13<sup>th</sup> Avenue/Madison Street intersections,
- Green time adjustments at signalized intersections along Madison and Spring Streets to reduce BRT delays, and

---

<sup>1</sup> As a note, in order to simplify the various alternative names that have been used during the project analysis, for the purposes of this memo, existing conditions was used to represent 2016 conditions, including the traffic volumes and signal timings that were observed in the field. No-build conditions refer to year 2019 conditions where the project is not implemented, where build conditions would be when the project was implemented and also refer to 2019 conditions.

- Re-optimization of traffic signal offsets at all signalized intersections outside of downtown Seattle.

### Traffic Operations Updates (Synchro)

Level of service (LOS) and delay results obtained from Synchro were updated for the AM and PM peak hour analysis under build conditions following inclusion of the Project Development design elements listed above.

As with the previously published Transportation Discipline Report, the intersection operations evaluated in Synchro used the 2010 Highway Capacity Manual (HCM) methodology, but used the 2000 HCM methodology when atypical geometric or signal design elements were included in the design. As with the previous traffic operations analysis done for the project, SDOT-established LOS standards within the City of Seattle were used for this analysis. LOS A, B, C, or D is considered acceptable, while heavily used or physically constrained intersections operating at LOS E or F may also be considered acceptable, as identified by SDOT on a case-by-case basis.

### Travel Time Updates (Vissim)

Elements of the project design, such as changes to intersection geometry, signal phasing, and splits would impact the localized intersection queuing and the overall travel times along the project corridor. The Vissim software package was used to capture detailed operational analysis along the corridor and to accurately model traffic operations resulting from transit lanes, turning vehicle interaction, pedestrian crossing, transit signal priority, and queue jumps.

Estimates of vehicular and transit travel times, as well as transit travel time reliability, were also updated as part of the Project Development design updates listed above. Transit travel time comparisons were made for the entire corridor in the westbound direction and for portions of the corridor in the eastbound direction, since existing buses do not operate along the entire corridor - they operate between 3<sup>rd</sup> and 7<sup>th</sup> Avenues along Spring Street and between 9<sup>th</sup> Avenue and Martin Luther King Jr. Way along Madison Street.

### AM Peak Hour Updates

Project Development design elements were applied to the Synchro and Vissim models that were created for the previous AM peak hour build analysis conducted in March 2017, which was based on the 2017 PD design. Following inclusion of the Project Development design elements as described and analyzed above, weekday AM peak hour analysis was conducted using the Synchro and Vissim software packages to understand the operations of the project during typical morning rush hour conditions.

### Traffic Operations Analysis (Synchro)

Intersection LOS and delay estimates were obtained from the Synchro models for the AM peak hour under existing, no-build, and build conditions (for both 2017 and 2018 PD designs). **Table 1** below shows the results for the intersection operations during the weekday AM peak hour under existing, no-build, and build conditions. The delay values shown below are for signalized intersections along the corridor, with average vehicle delay value shown at each intersection during the AM peak hour.

A review shows that all signalized intersections operate at LOS D or better except for the intersection of Boren Avenue and Madison Street, which operates at LOS E under existing conditions and would operate at LOS E and F under no-build and build conditions, respectively. As noted previously, LOS E or F may be considered acceptable by SDOT on a case-by-case basis.

Compared to the 2017 PD design, the 2018 PD design results in considerable changes to the intersection LOS and delay values at the following intersections:

- **13<sup>th</sup> Avenue/Madison Street:** The LOS at this intersection worsened from LOS B to LOS C with the 2018 PD design. Primary contributing factors include the elimination of a dedicated pedestrian phase, the separation of northbound and southbound movements into distinct phases, and the increase in green times for the BRT approach.
- **14<sup>th</sup> Avenue/Madison Street:** The LOS at this intersection worsened from LOS B to LOS C with the 2018 PD design. Primary contributing factors include the addition of a permissive northbound left-turning movement at 14<sup>th</sup> Avenue and the increase in green times for the BRT approach.

Despite these changes, the above two intersections are expected to continue to operate at an acceptable LOS value.

**Table 1 Summary of AM Peak Hour Conditions Delay and Level of Service**

Intersection	Existing Conditions		2019 No-Build Conditions		2019 Build Conditions (2017 PD Design)		2019 Build Conditions (2018 PD Design)

Notes:

\* Intersections will be signalized in build conditions and are not currently signalized.

Intersections highlighted in bold operate at LOS E or F. LOS E or F may be considered acceptable as identified by SDOT on a case-by-case basis.

### Travel Time Updates (Vissim)

The Vissim software package was used to conduct a detailed operational analysis along the corridor under existing and no-build conditions during the AM peak hour, and to understand the operational changes to the corridor should the project be implemented, particularly since the design would introduce many new transportation elements such as transit lanes, transit signal priority, and queue jumps that would substantially alter the way the corridor functions and performs.

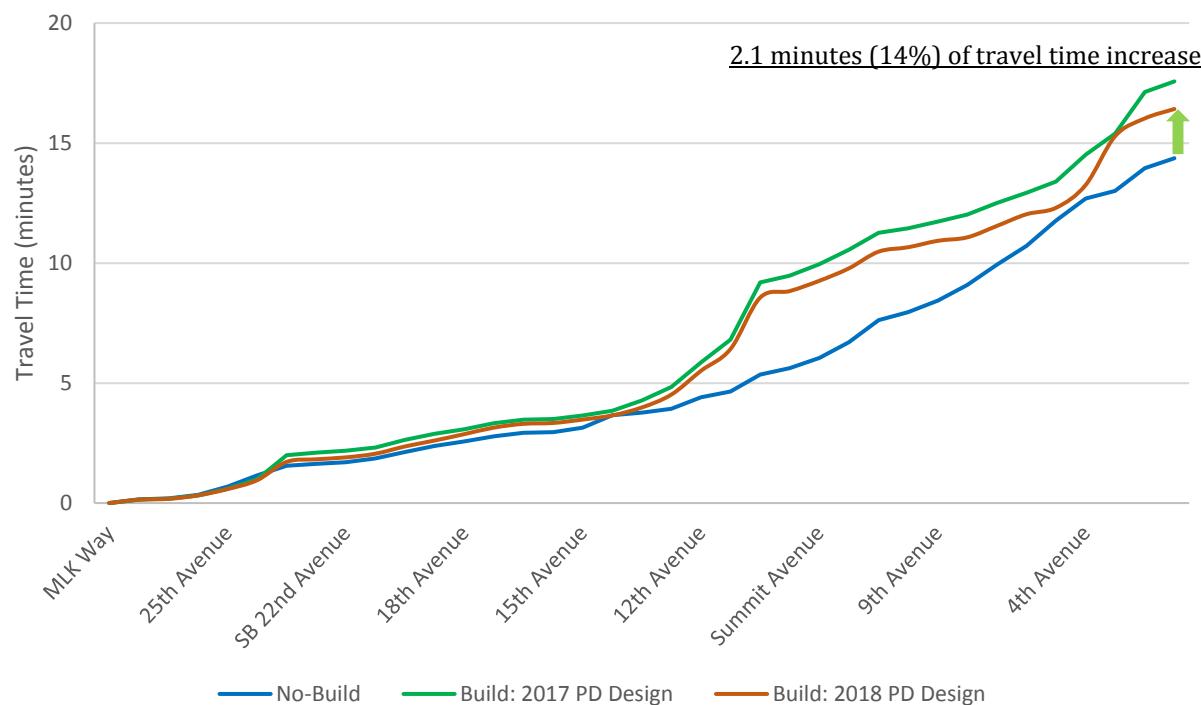

Estimates of vehicular and transit travel times, as well as transit travel time reliability, were calculated as part of this analysis. The graphs below show differences in travel times in each direction should the project be implemented.

### Westbound Motor Vehicle Travel Time

**Figure 1** shows the travel times for westbound motor vehicles under no-build and build conditions (for both 2017 and 2018 PD designs). The 2018 PD design would result in an increase in travel time of about 2.1 minutes relative to the no-build conditions, or a 14 percent increase, from approximately 14.4 to 16.5 minutes. This is the peak travel direction along Madison Street during the AM peak hour; with changes under build conditions like the travel lane reduction from two to one lane, it is expected to see vehicle travel times increase.

Compared to the 2017 PD design, the 2018 PD design would result in a decrease in travel time of about 1.1 minutes, or a 6.5 percent decrease, from 17.6 to 16.5 minutes. As shown in **Figure 1**, the cumulative travel time curves for the two build scenarios representing the 2017 and 2018 PD designs diverge somewhere between 12<sup>th</sup> Avenue/Madison Street and 9<sup>th</sup> Avenue/Madison Street intersections, indicating that the travel time improvement under the 2018 PD design is largely due to the operational changes implemented at the intersections located within that section.

**Figure 1: Westbound Motor Vehicle Travel Times (AM Peak Hour)**

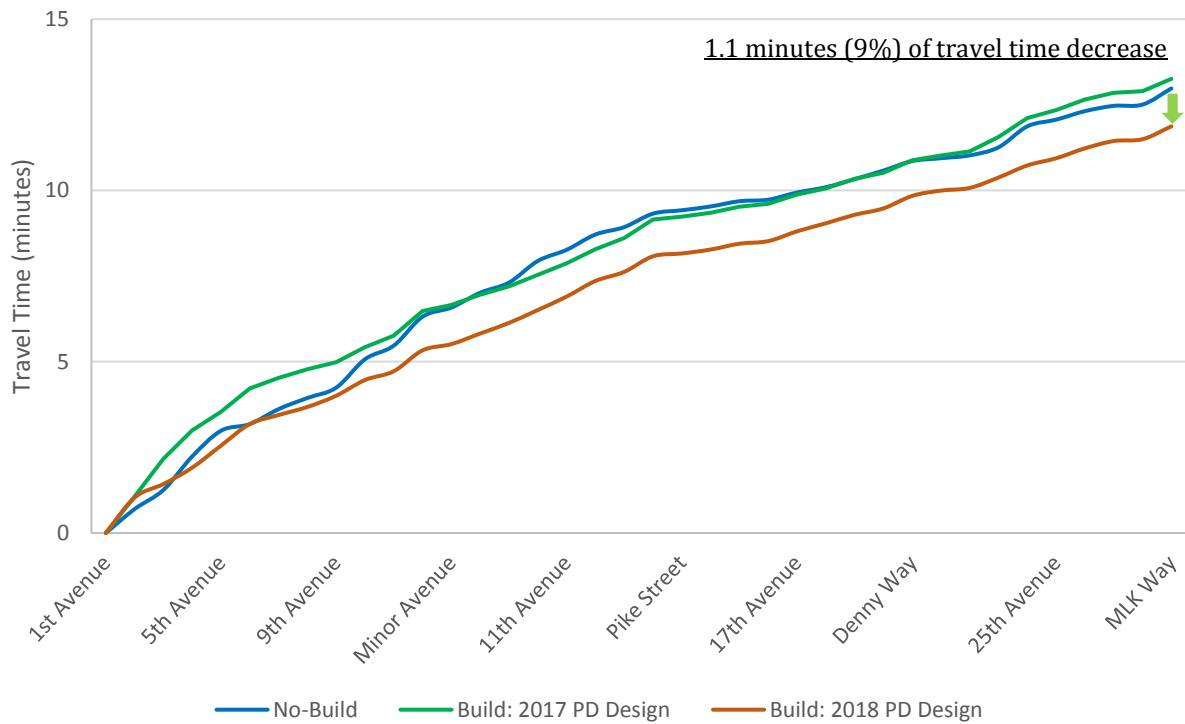

### *Eastbound Motor Vehicle Travel Time*

**Figure 2** shows the travel times for eastbound motor vehicles under no-build and build conditions (for both 2017 and 2018 PD designs). The 2018 PD design would result in a travel time decrease of about 1.1 minutes relative to no-build conditions, or a 9 percent decrease, from approximately 13.0 to 11.9 minutes. The through capacity would generally remain the same under build and existing conditions, as eastbound AM travel is currently served by one through lane on Madison Street and will continue to be served by one through lane under build conditions. As such, little to no change in vehicle travel times is expected. However, due to green time adjustments provided at multiple signalized intersections to reduce BRT delays, travel times for eastbound motor vehicles would also improve as illustrated by **Figure 2**.

Compared to the 2017 PD design, the 2018 PD design would result in a decrease in motor vehicle travel time of about 1.4 minutes, or a 10.5 percent decrease, from 13.3 to 11.9 minutes. This is largely due to the green time adjustments provided at 7<sup>th</sup> Avenue/Spring Street, 8<sup>th</sup> Avenue/Spring Street, and 9<sup>th</sup> Avenue/Spring Street intersections to improve the BRT performance.

**Figure 2: Eastbound Motor Vehicle Travel Time (AM Peak Hour)**

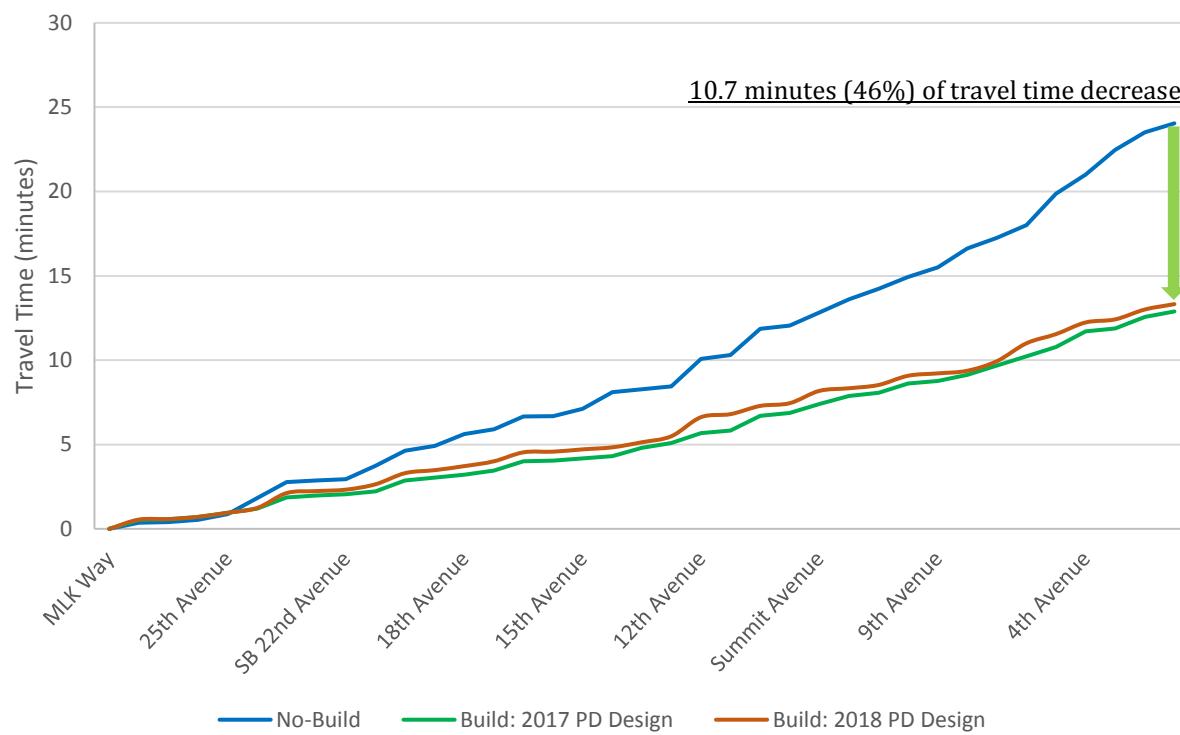

### *Westbound Transit Travel Time*

**Figure 3** shows the travel times for westbound transit under no-build and build conditions (for both 2017 and 2018 PD designs). Westbound buses travel along Madison Street for the entirety of the Vissim study area. The 2018 PD design would result in a decrease in travel time of about 10.7 minutes relative to the no-build conditions, or a 46 percent reduction, from approximately 24.0 to 13.3 minutes. Along with the provision of transit signal priority, the provision of the BRT-exclusive lane for most of the project corridor would allow transit to bypass major congestion points, resulting in a significant travel time reduction.

Compared to the 2017 PD design, the 2018 PD design would result in little to no changes in travel time for westbound transit although green times have been adjusted at multiple intersections along the BRT travel direction.

**Figure 3: Westbound Transit Travel Time (AM Peak Hour)**

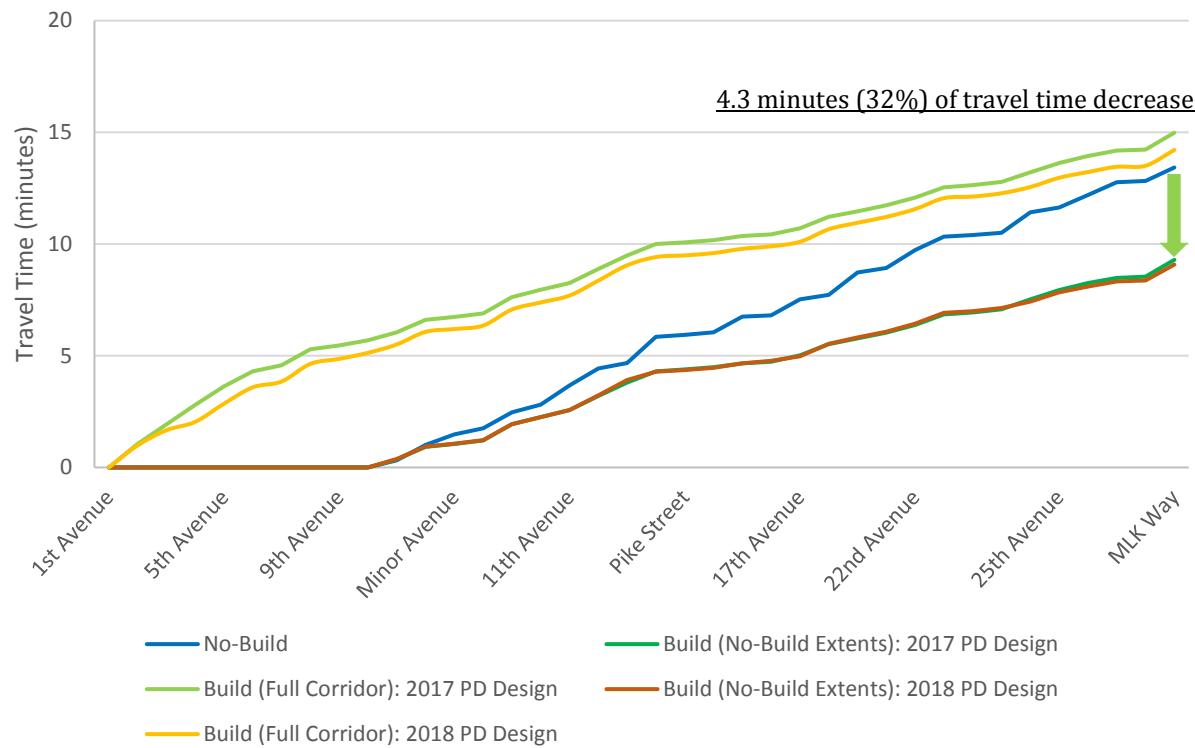

### *Eastbound Transit Travel Time*

**Figure 4** shows the travel times for eastbound transit under no-build and build conditions (for both 2017 and 2018 PD designs). Eastbound buses travel along Spring Street, turn southward onto 9<sup>th</sup> Avenue, turn onto Madison Street, and continue east. As previously noted, continuous eastbound no-build transit service is provided only for a portion of the Madison Street corridor, between 9<sup>th</sup> Avenue and Martin Luther King Jr. Way. As such, results for eastbound travel under build conditions were calculated for the entire corridor as well as for the no-build extents (from 9<sup>th</sup> Avenue to Martin Luther King Jr. Way). Within the no-build project extents, the 2018 PD design would result in a decrease in

travel time of about 4.3 minutes relative to the no-build conditions. This would constitute a 32 percent reduction, from approximately 13.4 minutes to 9.1 minutes.

Compared to the 2017 PD design, the 2018 PD design would result in little to no changes in transit travel time along the no-build project extents. However, the overall eastbound transit travel time from 1<sup>st</sup> Avenue/Spring Street intersection to the east terminus point would decrease by about 0.8 minutes, from 15.0 minutes with the 2017 PD design to 14.2 minutes with the 2018 PD design. These observations indicate that the operational improvements implemented within the downtown area, particularly from 6<sup>th</sup> to 9<sup>th</sup> Avenues, would result in more efficient eastbound transit operations.

**Figure 4: Eastbound Transit Travel Time (AM Peak Hour)**

#### *Transit Travel Time Reliability*

**Table 2** shows the transit service reliability during the AM peak hour over the Vissim study area under no-build and build conditions. With the 2018 PD design, transit reliability is expected to have a standard deviation of less than 1.0; 0.3 in the eastbound direction from 9<sup>th</sup> Street to Martin Luther King Jr. Way, 0.4 in the eastbound direction along the entire corridor from 1<sup>st</sup> Street to Martin Luther King Jr. Way, and 0.2 in the westbound direction.

Transit reliability under build conditions with the 2018 PD design would improve compared to no-build conditions in both directions of travel, as shown by the decrease in standard deviation from 1.2 under no-build conditions to 0.2 under build conditions in the westbound direction, and from 0.8 to 0.3 in the eastbound direction, respectively.

Compared to the 2017 PD design, the 2018 PD design would result in little to no change in transit reliability in both directions of travel.

**Table 2 Transit Travel Time Reliability (AM Peak Hour)**

Scenario	Direction	Transit Travel Time (minutes)				
		Segment	Min.	Max.	Avg.	Std. Dev.
No-Build	Eastbound	9 <sup>th</sup> Avenue to Martin Luther King Jr. Way	14.1	16.1	15.1	0.8
	Westbound	Martin Luther King Jr. Way to 1 <sup>st</sup> Avenue	20.8	24.2	22.5	1.2
Build (2017 PD Design)	Eastbound	9 <sup>th</sup> Avenue to Martin Luther King Jr. Way	9.6	10.3	9.9	0.3
	Eastbound	1 <sup>st</sup> Avenue to Martin Luther King Jr. Way	15.2	16.0	15.6	0.3
	Westbound	Martin Luther King Jr. Way to 1 <sup>st</sup> Avenue	12.3	13.2	12.8	0.4
Build (2018 PD Design)	Eastbound	9 <sup>th</sup> Avenue to Martin Luther King Jr. Way	9.6	10.3	10.0	0.3
	Eastbound	1 <sup>st</sup> Avenue to Martin Luther King Jr. Way	14.6	15.5	15.1	0.4
	Westbound	Martin Luther King Jr. Way to 1 <sup>st</sup> Avenue	12.8	13.2	13.0	0.2

## PM Peak Hour Updates

Project Development design elements were applied to the Synchro and Vissim models that were created for the previous PM peak hour build analysis conducted in March 2017, which was based on the 2017 PD design. Following inclusion of the 2018 PD design elements as described and analyzed earlier, weekday PM peak hour analysis was conducted using the Synchro and Vissim software packages to understand the study corridor operations during typical evening rush hour conditions.

## Traffic Operations Analysis (Synchro)

Intersection LOS and delay estimates were obtained from the Synchro models for the PM peak hour under existing, no-build, and build conditions (for both 2017 and 2018 PD designs). **Table 3** below shows the results for the intersection operations during the PM peak hour under existing, no-build, and build conditions. The delays shown below are the conditions at signalized intersections along the corridor, with average vehicle delay shown at each intersection during the PM peak hour. A review shows that all signalized intersections operate at LOS D or better except for the intersections of 2<sup>nd</sup> Avenue/Spring Street and 6<sup>th</sup> Avenue/Spring Street which operate at LOS E or F. As noted previously, LOS E or F may be considered acceptable by SDOT on a case-by-case basis.

Compared to the 2017 PD design, the 2018 PD design results in considerable changes to the intersection LOS and delay values at the following intersections:

- **13<sup>th</sup> Avenue/Madison Street:** The LOS at this intersection worsened from LOS B to LOS C with the 2018 PD design. Primary contributing factors include the elimination of a dedicated pedestrian phase, the separation of northbound and southbound movements into distinct phases, and the increase in green times for the BRT approach.

- **28<sup>th</sup> Avenue/Martin Luther King Jr. Way/E Madison Street:** The LOS at this intersection improved from LOS C to LOS B with the 2018 PD design. Primary contributing factors include the conversion of the eastbound lanes from eastbound-left and eastbound through/right to eastbound through and eastbound right and the increase in the green times for the BRT approach.
- **9<sup>th</sup> Avenue/Spring Street:** The LOS at this intersection worsened from LOS B to LOS C with the 2018 PD design. Primary contributing factors include the addition of a dedicated bicycle phase to the signal cycle and the increase in green times for the BRT approach.

Despite these changes, the above three intersections are expected to continue to operate at an acceptable LOS.

**Table 3 Summary of PM Peak Hour Build Conditions Delay and Level of Service**

Notes:

\* Intersections will be signalized in build conditions and are not currently signalized.

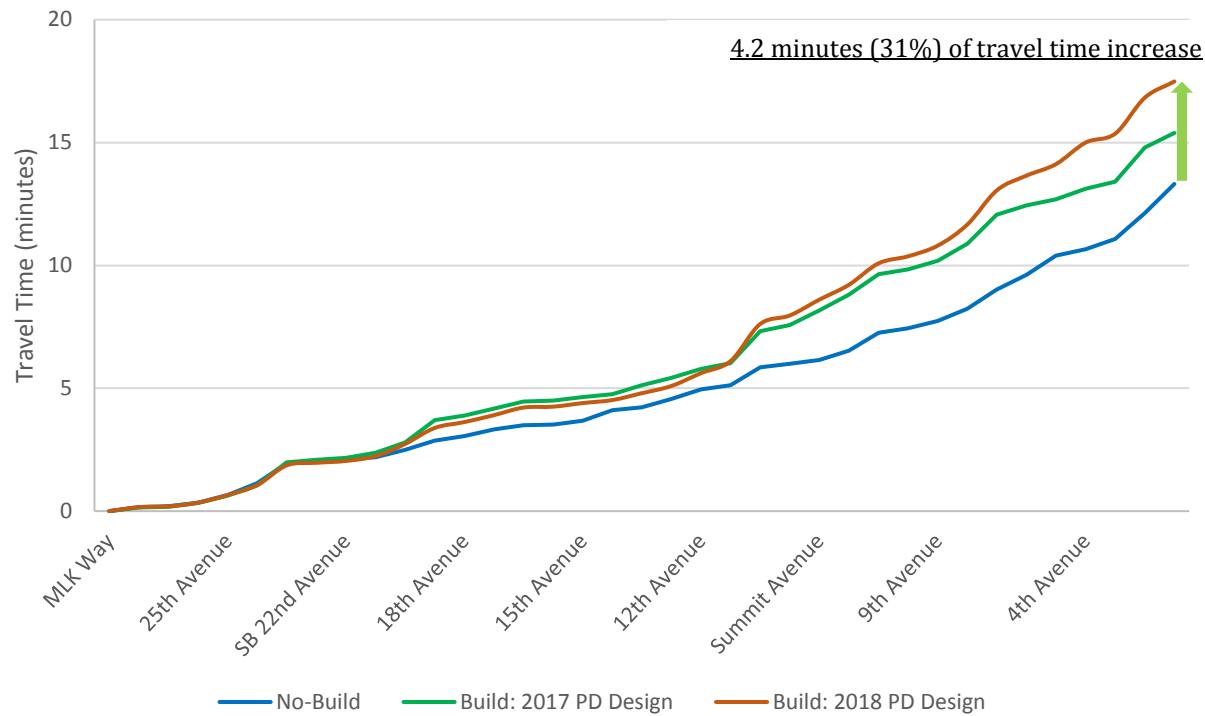

Intersections highlighted in bold operate at LOS E or F. LOS E or F may be considered acceptable as identified by SDOT on a case-by-case basis.

#### Westbound Motor Vehicle Travel Time

**Figure 5** shows the travel times for westbound motor vehicles under the no-build and build conditions (for both 2017 and 2018 PD designs). The build conditions would result in a 4.2-minute travel time increase relative to the no-build conditions, or about a 31 percent increase, from approximately 13.3 minutes to 17.5 minutes. As mentioned earlier, with the westbound travel lane reduction from two to one lane under the build conditions, it is expected to see vehicle travel times increase.

Compared to the 2017 PD design, the 2018 PD design would result in an increase of about 2.1 minutes in travel time, or about a 13.7% increase, from about 15.4 to 17.5 minutes. **Figure 5** shows that the cumulative travel time curves for the two scenarios considered diverge somewhere within the downtown area. This can be explained by the fact that the green time extensions were only implemented at multiple intersections upstream of the downtown area, thereby increasing the flow to the downtown while keeping the signal capacity within the downtown area constant, which ultimately results in more congestion and longer travel times within that area under the 2018 PD design.

**Figure 5: Westbound Motor Vehicle Travel Times (PM Peak Hour)**

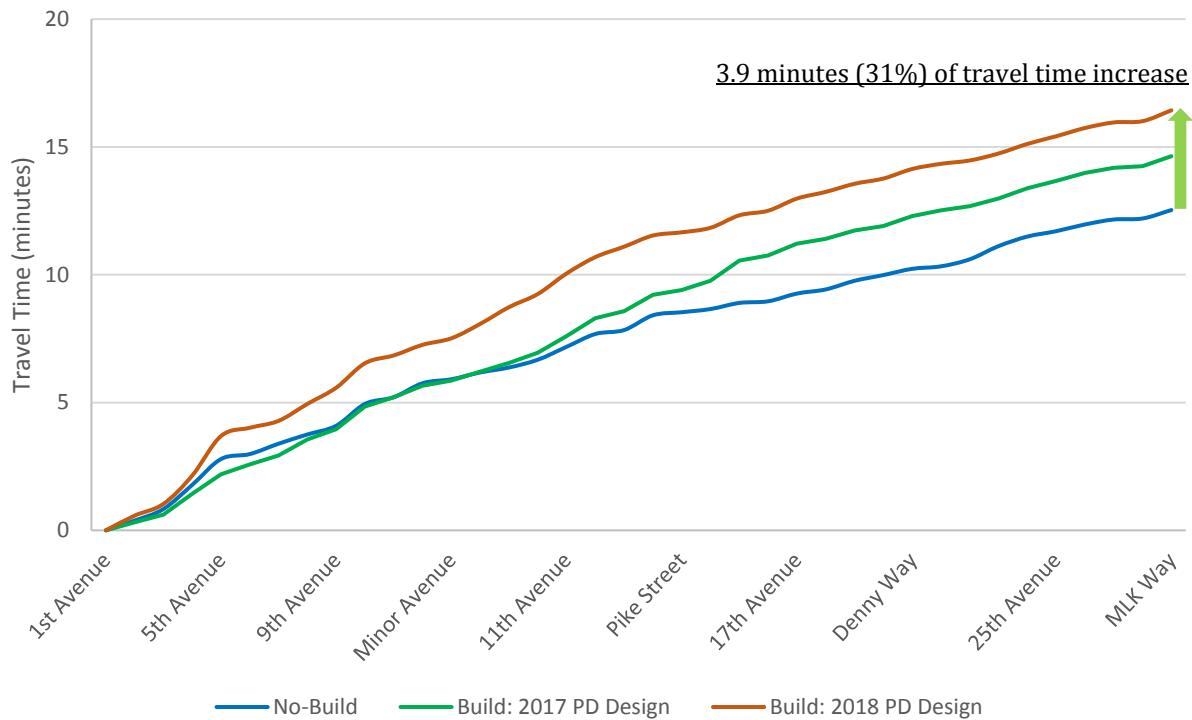

#### *Eastbound Motor Vehicle Travel Time*

**Figure 6** shows the travel times for eastbound motor vehicles under the no-build and build conditions (for both 2017 and 2018 PD designs). The 2018 PD design would result in an increase in travel time of about 3.9 minutes relative to the no-build conditions, or a 31 percent increase, from approximately 12.5 to 16.4 minutes.

Compared to the 2017 PD design, the 2018 PD design would result in an increase of 1.8 minutes in travel time, or about a 12% increase, from approximately 14.6 minutes to 16.4 minutes.

**Figure 6: Eastbound Motor Vehicle Travel Time (PM Peak Hour)**

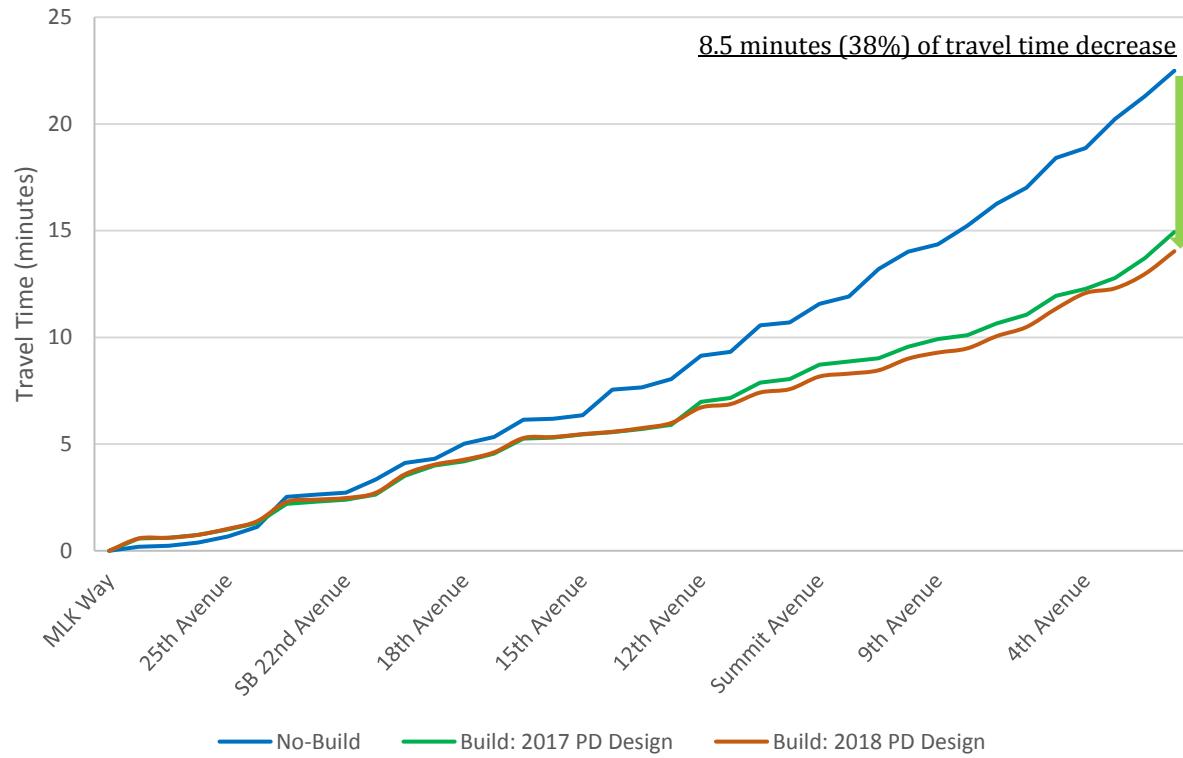

#### *Westbound Transit Travel Time*

**Figure 7** shows the travel times for the westbound transit under the no-build and build conditions (for both 2017 and 2018 PD designs). Westbound buses travel along Madison Street for the entirety of the Vissim study area. The 2018 PD design would result in a decrease in travel time of about 8.5 minutes, or a 38 percent reduction, from approximately 22.5 minutes to 14.0 minutes.

Compared to the 2017 PD design, the 2018 PD design would result in a decrease of about 0.9 minutes in transit travel time, or about a 6% decrease, from approximately 14.9 to 14.0 minutes.

**Figure 7: Westbound Transit Travel Time (PM Peak Hour)**

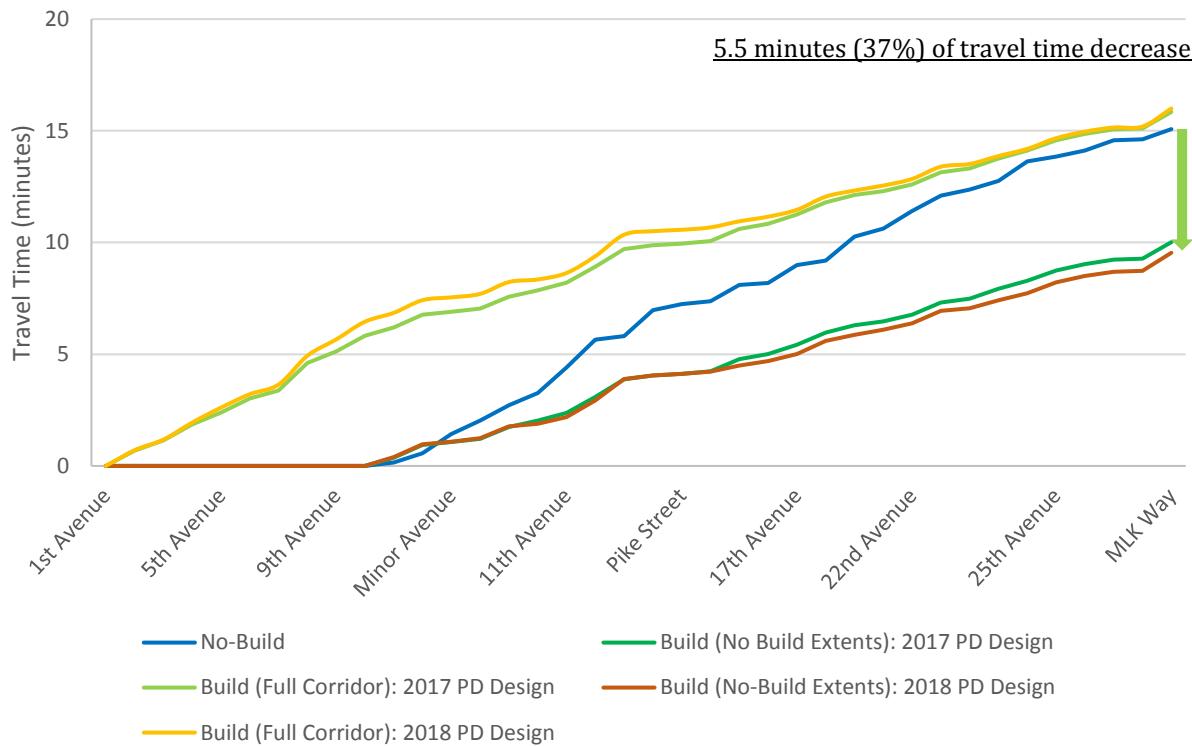

#### *Eastbound Transit Travel Time*

**Figure 8** shows the travel times for the eastbound transit under the no-build and build conditions (for both 2017 and 2018 PD designs). Eastbound buses travel along Spring Street, turn southward onto 9<sup>th</sup> Avenue, then turn onto Madison Street and continue eastbound. As previously noted, continuous eastbound no-build transit service is only provided on a portion of the Madison corridor, between 9<sup>th</sup> Avenue and Martin Luther King Jr. Way. As such, eastbound build results were calculated for the entire corridor as well as for the no-build extents (from 9<sup>th</sup> Avenue to Martin Luther King Jr. Way).

Within the no-build extents, the 2018 PD design would result in a decrease of about 5.6 minutes in travel time relative to the no-build conditions, or a 37 percent reduction, from approximately 15.1 minutes to 9.5 minutes.

Compared to the 2017 PD design, the 2018 PD design would result in a decrease of about 0.5 minutes in transit travel time, or about a 5% decrease, from approximately 10.0 to 9.5 minutes along the no-build extents. There is little to no changes in travel time for eastbound transit when considering the entire corridor.

**Figure 8: Eastbound Transit Travel Time (PM Peak Hour)**

#### *Transit Travel Time Reliability*

**Table 4** shows the transit service reliability over the entire Vissim study area for the no-build and build conditions (for both 2017 and 2018 PD designs). Reliability of transit service under the 2018 PD design is expected to have a standard deviation of less than 1.0; 0.6 in the eastbound direction from 9<sup>th</sup> Street to Martin Luther King Jr. Way, 0.7 in the eastbound direction along the entire corridor from 1<sup>st</sup> Street to Martin Luther King Jr. Way, and 0.8 in the westbound direction.

Transit reliability under build conditions with the 2018 PD design would improve compared to the no-build conditions in both directions of travel, as shown by the decrease in standard deviation from 1.2 under no-build conditions to 0.8 under build conditions in the westbound direction, and from 0.8 to 0.6 in the eastbound direction, respectively.

Compared to the 2017 PD design, the 2018 PD design would result in a less reliable service as shown by the increase in standard deviation from 0.7 to 0.8 in the westbound direction, 0.2 to 0.6 in the eastbound direction along the no-build extents, and 0.5 to 0.7 in the eastbound direction along the entire corridor.

**Table 4 Transit Travel Time Reliability (PM Peak Hour)**

Scenario	Direction	Transit Travel Time (minutes)				
		Segment	Min.	Max.	Avg.	Std. Dev.
No-Build	Eastbound	9th Avenue to Martin Luther King Jr. Way	14.1	16.1	15.1	0.8
	Westbound	Martin Luther King Jr, Way to 1st Avenue	20.8	24.2	22.5	1.2
Build (2017 PD Design)	Eastbound	9th Avenue to Martin Luther King Jr. Way	9.7	10.3	10.0	0.2
	Eastbound	1st Avenue to Martin Luther King Jr. Way	15.4	16.7	15.8	0.5
	Westbound	Martin Luther King Jr, Way to 1st Avenue	13.8	15.7	14.9	0.7
Build (2018 PD Design)	Eastbound	9th Avenue to Martin Luther King Jr. Way	9.7	11.2	10.1	0.6
	Eastbound	1st Avenue to Martin Luther King Jr. Way	15.6	17.2	16.2	0.7
	Westbound	Martin Luther King Jr, Way to 1st Avenue	12.5	14.4	13.3	0.8
